Illustrated Computer Tomography

A Practical Guide to CT Interpretations

Editor: **S. Takahashi**

With the assistance of S. Sakuma, M. Kaneko

1983. 313 figures, partly colored. XII, 306 pages. ISBN 3-540-11432-7

Contents: Introduction. - Basic Aspects of Computed Tomography. - Atlas of Computed Tomography of the Normal Adult. - Clinical Application of Computed Tomography. - Radiotherapy Planning and Computed Tomography. - References. - Subject Index.

Here at last is the guide practitioners have been waiting for. Written by leading authorities in fields ranging from diagnostic radiology to neurosurgery and medical technology, it is the first to provide a comprehensive modern atlas of normal CT scans and their corresponding anatomical sections as a preliminary to CT imaging in clinical abnormalities. The book opens with a discussion of the basic aspects of computer tomography: its history and principles, apparatus, procedures, and image evaluation. Part 2 contains a complete atlas of axial transverse CT cross sections in the normal adult, complemented by anteroposterior and lateral X-ray views and anatomical diagrams for each CT image. This is designed to facilitate understanding of the clinical applications of CT in the diagnosis and treatment of diseases of the brain, head and neck, trunk, and extremities described in Part 3. The book concludes with a consideration of the role of computer tomography in radiotherapy planning.

With the ever-increasing significance of computer tomography in today's medicine this book will prove indispensable for every physician seeking firm understanding of an important diagnostic tool.

Atlas of Pathological Computer Tomography

Volume 1

A. Wackenheim, L. Jeanmart, A.L. Baert

Craniocerebral Computer Tomography

Confrontations with Neuropathology

With collaboration of D. Baleriaux, D. Crolla, J. Dietemann, R. Dom, J. Flament, N. Heldt, Y. Palmers, J. Termote

1980. 112 figures in 498 separate illustrations. X, 130 pages. ISBN 3-540-09879-8

Contents: Malformations. - Infections. - Hematomas. - Ischemias. - Atrophies. - Gliomas. - Metastases. - Tumor of the Pituitary Area. - Reticulosarcomas. - Ependymomas. - Pinealomas. - Meningiomas. - References.

This volume is the first in a three-part work on the use of computer tomography for examining pathologic morphology in the human cranio-cerebral and trunk regions. Intended primarily as a teaching manual, the examples it contains were chosen for their didactic excellence from studies made at the Universities of Staßbourg, Brussels and Louvain.

In this volume, anatomic and CT data on neuropathologic morphology are compared in atlas form. Various types of lesions are covered, providing a striking demonstration of the effectiveness of CT as an examination tool.

Volume 2

A.L. Baert, A. Wackenheim, L. Jeanmart

Abdominal Computer Tomography

With collaboration of G. Marchal, G. Wilms

1980. 315 figures in 585 separate illustrations. XI, 185 pages. ISBN 3-540-10093-8

Contents: Introduction. - Kidney. - Adrenals. - Retroperitoneum. - Pelvis. - Abdominal Cavity and Abdominal Wall. - Liver. - Gall Bladder and Biliary Tract. - Pancreas. - Spleen. - Subject Index.

This atlas is the product of years of clinical experience and is based on over 5000 abdominal examinations performed with a fourth-generation, two-second scanner. More than 500 illustrations serve to demonstrate the usefulness of computer tomography in providing a detailed survey of normal transverse anatomy in vivo, of its normal variants, and of a wide range of pathological conditions in abdominal organs. Emphasis is placed on the possibilities of differential tissue enhancement by combining short scan times, sequential scanning and fast intravenous bolus administration of iodinated contrast medium. The atlas will be invaluable both for users of slower, second-generation scanners and for the increasing number of users of newer, high-speed equipment. Without doubt it is a mile-stone in diagnostic radiology of the abdomen.

Clinical Computer Tomography

Head and Trunk

Editors: A. Baert, L. Jeanmart, A. Wackenheim

1978. 414 figures, 2 tables. VIII, 261 pages. ISBN 3-540-08458-4

This book represents a new approach to computer tomography of the brain and is the first overall view of its applications in the study of the human trunk in clinical pathology.

These papers were presented at the first meeting on tomodensitometry (computer tomography) to be organized by the College d'enseignement post-universitaire de Radiologie (CEPUR), an international association for the promotion of courses in advanced radiology. Essentially the result of a team effort by three European radiological centers, the work is based on new observations on the use of this recently developed radiological technique on the head and trunk.
