Manual of Clinical Oncology

Edited under the auspices of the
International Union Against Cancer
3rd fully revised edition. 1982. 44 figures.
XV, 346 pages
ISBN 3-540-11746-6

The continuing success of the UICC's *Clinical Oncology*, the refinement of their educational objectives for medical students and young practitioners, and the significant advances scored over the last few years in cancer research have all led to the decision to publish a third edition of this manual. It presents students and practitioners with a concise summary of essential oncological knowledge. Although emphasis is placed on basic aspects, the clinical implications are made clear.

"... this well-prepared compact volume fulfills admirably its role as an aid to the understanding of malignant disease for all sections of the medical community."

TNM-Atlas

Illustrated Guide to the Classification of
Malignant Tumors

Editors: **B. Spiessl, O. Scheibe, G. Wagner**

1982. 311 figures. XII, 229 pages

ISBN 3-540-11429-7

The *TNM-Atlas* is an illustrated guide to the UICC's system for classifying malignant tumors, a system that has been adopted worldwide since introduction of the definitive version in 1978. The atlas is designed to facilitate documentation of clinical findings by combining the precisely graded TNM classifications with topographical drawings of the organ or anatomic section under consideration. All physicians actively engaged in clinical oncology will find that this book provides the ideal framework within which to conduct daily anamnesis.

Positron Emission Tomography of the Brain

Editors: **W.-D. Heiss, M.F. Phelps**

1983. 108 figures. XVIII, 224 pages
ISBN 3-540-12130-7

The contributions by noted international researchers contained in this book provide a critical survey of the scientific and clinical capability of positron emission tomography for measuring cerebral metabolism. The authors review the principles involved, the methodology for regional quantification of isotope content in brain tissue, and the isotopes and labeled compounds used. Techniques and clinical results of regional blood flow measurement, oxygen uptake and glucose metabolism are extensively reported, and new developments and initial results of quantification of regional protein synthesis and receptor distribution are indicated.

Early Detection of Breast Cancer

Editors: **S. Br nner, B. Langfeldt, P. E. Andersen**

1984. 94 figures. XI, 214 pages
(Recent Results in Cancer Research, Volume 90)
ISBN 3-540-12348-2

Springer-Verlag
Berlin
Heidelberg
New York
Tokyo

The contributions presented in this book deal with all aspects of the diagnosis, classification, pathological anatomy, and treatment of breast cancer. Of special interest are reports on the results of screening projects in Sweden and the USA, on progress in early diagnosis using ultrasound and subtraction techniques, and on the current use of irradiation and breast-preserving surgical intervention in place of mastectomy in the USA and Denmark. The book is a synthesis of valuable information from scientists at leading mammographic centers, and will be useful to diagnosticians, radiotherapists, and surgeons as well as to medical students.
