Preface

This textbook is intended for an introductory followed by an advanced course in linear algebra, with emphasis on its interactions with other topics in mathematics, such as calculus, geometry, and combinatorics. We took a straightforward path to the most important topic, linear maps between vector spaces, most of the time finite dimensional. However, since these concepts are fairly abstract and not necessarily natural at first sight, we included a few chapters with explicit examples of vector spaces such as the standard n -dimensional vector space over a field and spaces of matrices. We believe that it is fundamental for the student to be very familiar with these spaces before dealing with more abstract theory. In order to maximize the clarity of the concepts discussed, we included a rather lengthy chapter on 2×2 matrices and their applications, including the theory of Pell's equations. This will help the student manipulate matrices and vectors in a concrete way before delving into the abstract and very powerful approach to linear algebra through the study of vector spaces and linear maps.

The first few chapters deal with elementary properties of vectors and matrices and the basic operations that one can perform on them. A special emphasis is placed on the Gaussian Reduction algorithm and its applications. This algorithm provides efficient ways of computing some of the objects that appear naturally in abstract linear algebra such as kernels and images of linear maps, dimensions of vector spaces, and solutions to linear systems of equation. A student mastering this algorithm and its applications will therefore have a much better chance of understanding many of the key notions and results introduced in subsequent chapters.

The bulk of the book contains a comprehensive study of vector spaces and linear maps between them. We introduce and develop the necessary tools along the way, by discussing the many examples and problems proposed to the student. We offer a thorough exposition of central concepts in linear algebra through a problem-based approach. This is more challenging for the students, since they have to spend time trying to solve the proposed problems after reading and digesting the theoretical

material. In order to assist with the comprehension of the material, we provided solutions to all problems posed in the theoretical part. On the other hand, at the end of each chapter, the student will find a rather long list of proposed problems, for which no solution is offered. This is because they are similar to the problems discussed in the theoretical part and thus should not cause difficulties to a reader who understood the theory.

We truly hope that you will have a wonderful experience in your linear algebra journey.

Contents

1	Matrix Algebra	1
1.1	Vectors, Matrices, and Basic Operations on Them	3
1.1.1	Problems for Practice	10
1.2	Matrices as Linear Maps	11
1.2.1	Problems for Practice	14
1.3	Matrix Multiplication	15
1.3.1	Problems for Practice	26
1.4	Block Matrices	29
1.4.1	Problems for Practice	31
1.5	Invertible Matrices	31
1.5.1	Problems for Practice	41
1.6	The Transpose of a Matrix	44
1.6.1	Problems for Practice	51
2	Square Matrices of Order 2	53
2.1	The Trace and the Determinant Maps	53
2.1.1	Problems for Practice	56
2.2	The Characteristic Polynomial and the Cayley–Hamilton Theorem	57
2.2.1	Problems for Practice	65
2.3	The Powers of a Square Matrix of Order 2	67
2.3.1	Problems for Practice	70
2.4	Application to Linear Recurrences	70
2.4.1	Problems for Practice	73
2.5	Solving the Equation $X^n = A$	74
2.5.1	Problems for Practice	78
2.6	Application to Pell’s Equations	79
2.6.1	Problems for Practice	83

3	Matrices and Linear Equations	85
3.1	Linear Systems: The Basic Vocabulary	85
3.1.1	Problems for Practice	87
3.2	The Reduced Row-Echelon form and Its Relevance to Linear Systems	88
3.2.1	Problems for Practice	95
3.3	Solving the System $AX = b$	96
3.3.1	Problems for Practice	99
3.4	Computing the Inverse of a Matrix	100
3.4.1	Problems for Practice	105
4	Vector Spaces and Subspaces	107
4.1	Vector Spaces-Definition, Basic Properties and Examples	107
4.1.1	Problems for Practice	113
4.2	Subspaces	114
4.2.1	Problems for Practice	121
4.3	Linear Combinations and Span	122
4.3.1	Problems for Practice	127
4.4	Linear Independence	128
4.4.1	Problems for Practice	133
4.5	Dimension Theory	135
4.5.1	Problems for Practice	146
5	Linear Transformations	149
5.1	Definitions and Objects Canonically Attached to a Linear Map	149
5.1.1	Problems for practice	157
5.2	Linear Maps and Linearly Independent Sets	159
5.2.1	Problems for practice	163
5.3	Matrix Representation of Linear Transformations	164
5.3.1	Problems for practice	181
5.4	Rank of a Linear Map and Rank of a Matrix	183
5.4.1	Problems for practice	194
6	Duality	197
6.1	The Dual Basis	197
6.1.1	Problems for Practice	208
6.2	Orthogonality and Equations for Subspaces	210
6.2.1	Problems for Practice	218
6.3	The Transpose of a Linear Transformation	220
6.3.1	Problems for Practice	224
6.4	Application to the Classification of Nilpotent Matrices	225
6.4.1	Problems for Practice	234
7	Determinants	237
7.1	Multilinear Maps	238
7.1.1	Problems for Practice	242

7.2	Determinant of a Family of Vectors, of a Matrix, and of a Linear Transformation	243
7.2.1	Problems for Practice	251
7.3	Main Properties of the Determinant of a Matrix	253
7.3.1	Problems for Practice	262
7.4	Computing Determinants in Practice	264
7.4.1	Problems for Practice	278
7.5	The Vandermonde Determinant	282
7.5.1	Problems for Practice	287
7.6	Linear Systems and Determinants	288
7.6.1	Problems for Practice	298
8	Polynomial Expressions of Linear Transformations and Matrices ...	301
8.1	Some Basic Constructions	301
8.1.1	Problems for Practice	303
8.2	The Minimal Polynomial of a Linear Transformation or Matrix ..	304
8.2.1	Problems for Practice	309
8.3	Eigenvectors and Eigenvalues	310
8.3.1	Problems for Practice	316
8.4	The Characteristic Polynomial	319
8.4.1	Problems for Practice	330
8.5	The Cayley–Hamilton Theorem	333
8.5.1	Problems for Practice	337
9	Diagonalizability	339
9.1	Upper-Triangular Matrices, Once Again	340
9.1.1	Problems for Practice	343
9.2	Diagonalizable Matrices and Linear Transformations	345
9.2.1	Problems for Practice	356
9.3	Some Applications of the Previous Ideas	359
9.3.1	Problems for Practice	372
10	Forms	377
10.1	Bilinear and Quadratic Forms	378
10.1.1	Problems for Practice	389
10.2	Positivity, Inner Products, and the Cauchy–Schwarz Inequality ...	391
10.2.1	Practice Problems	397
10.3	Bilinear Forms and Matrices	399
10.3.1	Problems for Practice	406
10.4	Duality and Orthogonality	408
10.4.1	Problems for Practice	416
10.5	Orthogonal Bases	418
10.5.1	Problems for Practice	436
10.6	The Adjoint of a Linear Transformation	442
10.6.1	Problems for Practice	448
10.7	The Orthogonal Group	450
10.7.1	Problems for Practice	465

10.8	The Spectral Theorem for Symmetric Linear Transformations and Matrices	469
10.8.1	Problems for Practice.....	477
11	Appendix: Algebraic Prerequisites	483
11.1	Groups	483
11.2	Permutations.....	484
11.2.1	The Symmetric Group S_n	484
11.2.2	Transpositions as Generators of S_n	486
11.2.3	The Signature Homomorphism	487
11.3	Polynomials	489
