This book is sold subject to the standard conditions of the
Net Book Agreement.

The paperback edition of this book is sold subject to the condition that it shall not, by way of trade or otherwise, be lent, resold, hired out, or otherwise circulated without the publisher's prior consent in any form of binding or cover other than that in which it is published and without a similar condition including this condition being imposed on the subsequent purchaser.

Contents

<i>Preface</i>	vii
1 Introduction	1
2 The Interconnection of Logic	4
3 The Analogy between L , C and R	7
4 Transmission Line Theory Applied to Logic Interconnection	15
5 Component Pulse Response	27
6 Distribution of D.C. Power to Logic	36
7 Local Decoupling of Voltage Supplies by Printed Circuit Voltage Planes	39
8 Printed Circuit Board Layout for High Speed Schottky TTL	43
9 Crosstalk	55
10 Energy Current	65
11 Grounding in a Digital System	69
12 Grounding in a System Comprising More Than One Module	73

13	Interference from the 50/60 Hz Line	78
14	Filtering the Line	83
15	Oscilloscopes for Digital Measurements	89
	<i>Appendix – Electrical Formulae</i>	94

Preface

The authors, who have long experience of research and development in digital electronics, became concerned at the lack of attention paid to the design of digital hardware by educational establishments. This book is based on material developed for a series of seminars which are now attended by engineers drawn from the design laboratories of many large electronics companies in the United Kingdom.

If and when colleges and faculties of electronics and physics realise that digital hardware design is a major discipline, this and subsequent volumes planned by the authors will be invaluable for the design of relevant and up-to-date courses.
