Contents

<i>Preface</i>	xi
1 Gases	1
1.1 Ideal and non-ideal gases	1
1.2 Application of the gas laws in aerosol formulation	3
1.3 Solubility of gases in liquids	6
1.3.1 Effect of temperature on solubility	7
1.3.2 Effect of pressure on solubility	7
1.3.3 Solubility of volatile anaesthetics in oil	8
1.3.4 Solubility of anaesthetic gases in blood and tissues	9
2 Properties of the Solid State	13
Introduction	
2.1 Crystal form and polymorphism	13
2.2 Crystallisation and factors affecting crystal form	16
2.3 Analytical implications of polymorphism	18
2.4 Thermomicroscopy	22
2.5 Relative stability of polymorphs and their bioavailability	22
2.6 Dissolution of solid drugs	25
2.7 Biopharmaceutical importance of particle size	26
2.8 Wetting of powders	33
2.9 Solid solutions and eutectics	33
2.9.1 Eutectics and drug identification	36
2.10 Crystal growth in suspensions	37
2.11 Dissolution testing of solid dosage forms	38
3 Liquids	43
3.1 The liquid state	43
3.2 Cohesive forces in polar and non-polar liquids	45
3.3 The structure of water	46
3.3.1 Hydrophobic bonding	47
3.4 Properties of liquids	49
3.4.1 Flow properties	49
3.4.2 Surface and interfacial tension	52
3.4.3 Dielectric properties	54
3.5 The liquid crystalline state	59

4 Solutions	65
Introduction	
4.1 Concentration units	65
4.2 Thermodynamics – basic principles	66
4.2.1 Definitions	66
4.2.2 Laws of thermodynamics	67
4.2.3 Free energy	73
4.2.4 Partial molar quantities – chemical potential	82
4.3 Thermodynamics of ideal and non-ideal solutions	84
4.3.1 Raoult's law	84
4.3.2 Concepts of fugacity and activity	86
4.3.3 Chemical potential in solution	93
4.4 Colligative properties	95
4.4.1 Vapour pressure lowering	95
4.4.2 Elevation of boiling point	96
4.4.3 Depression of freezing point	97
4.4.4 Osmotic pressure	98
4.5 Dynamic properties of electrolyte and non-electrolyte solutions	102
4.5.1 Conductance of electrolyte solutions	102
4.5.2 Diffusion	106
4.5.3 Viscosity	109
4.6 Ionisation of drugs in solution	110
4.6.1 Dissociation of weak acids and bases and their salts	111
4.6.2 The effect of pH on the ionisation of weakly acidic or basic drugs and their salts	112
4.6.3 Amphoteric electrolytes	117
4.6.4 Ionisation of polyprotic drugs and microdissociation constants	118
4.7 Buffer solutions	119
5 Solubility of Drugs in Liquids	125
Introduction	
5.1 Expressions of solubility	125
5.2 Determination of solubility	126
5.3 Factors affecting solubility	126
5.3.1 Solubility of solutes in liquids	128
5.3.2 Molecular surface area approach	129
5.3.3 Structural features of simple molecules and aqueous solubility	130
5.4 Hydration and solvation	134
5.4.1 Hydration of non-electrolytes	134
5.4.2 Hydration of ionic species	135
5.4.3 Hydrophobic hydration	135
5.5 The solubility of inorganic materials in water	136
5.6 Solubility products	137

5.7	The effects of additives on solubility: the solubility coefficient	137
5.8	Influence of crystal size	139
5.9	Solubility of weak electrolytes	139
5.9.1	Acidic drugs	139
5.9.2	Basic drugs	140
5.9.3	Amphoteric drugs	141
5.10	Determination of solubility of organic electrolytes in aqueous solution	147
5.11	The solubility parameter	149
5.11.1	Solubility parameters and biological processes	150
5.12	Drug solubility and biological activity	152
5.13	Solubility in mixed solvents	153
5.14	A recent formulation problem : Septrin infusion	154
5.15	The choice of drug salt	155
5.16	Partitioning phenomena	158
5.16.1	Extraction	160
5.16.2	Partitioning of weak electrolytes	162
5.17	Uses of log P	164
6	Surface Chemistry	173
	Introduction	
6.1	Amphipathic compounds	173
6.2	The liquid-gas and liquid-liquid interface	174
6.2.1	Effects of amphiphiles on surface and interfacial tension	174
6.2.2	Gibbs adsorption equation	175
6.2.3	Application of the Gibbs equation to surfactant solutions	177
6.2.4	Surface activity of drugs	179
6.2.5	Spreading	181
6.2.6	Insoluble monolayers	184
6.2.7	Pharmaceutical applications of surface film studies	188
6.3	The solid-liquid interface	192
6.3.1	Contact angle and wettability of solid surfaces	192
6.3.2	Wettability of powders	193
6.3.3	Adsorption at the solid-liquid interface	196
6.4	Micellisation	205
6.5	Properties of some commonly used surfactants	213
6.5.1	Anionic surfactants	213
6.5.2	Cationic surfactants	213
6.5.3	Nonionic surfactants	214
6.6	Solubilisation	216
6.6.1	Determination of maximum additive concentration	216
6.6.2	Location of solubilisate	217
6.6.3	Factors affecting solubilisation	218
6.6.4	Pharmaceutical applications of solubilisation	220

7 Colloidal and Coarse Lyophobic Dispersions	223
Introduction	
7.1 Classification of colloidal systems	224
7.2 Colloid stability	224
7.3 Emulsions	233
7.3.1 Stability of emulsions	233
7.3.2 HLB system	234
7.3.3 Multiple emulsions	238
7.3.4 Microemulsions	238
7.3.5 Biopharmaceutical aspects of emulsion systems	238
7.3.6 Preservative availability in emulsified systems	241
7.3.7 Mass transport in oil-water emulsions	242
7.3.8 Intravenous fat emulsions	247
7.4 Non-Newtonian flow	247
7.5 Pharmaceutical suspensions	251
7.5.1 Settling of suspended particles	251
7.5.2 Suspension stability	253
7.5.3 Extemporaneous suspensions	259
7.5.4 Rheology of suspensions of solid particles	259
7.5.5 Adhesion of suspension particles to containers	262
7.5.6 Crystal growth	265
7.6 Application of colloid theory to other systems	265
7.6.1 Cell-cell interactions	265
7.6.2 Sorption of microbial cells on surfaces	267
7.6.3 Blood as a colloidal system	269
7.7 Foams	271
7.7.1 Foams: clinical considerations	272
 8 Polymeric Systems	 275
Introduction	
8.1 Water-soluble polymers	278
8.2 General properties of polymer solutions	279
8.2.1 Polydispersity	279
8.2.2 Viscosity	281
8.2.3 Gelling tendency	282
8.2.4 Heterogels	284
8.2.5 Syneresis	285
8.2.6 Macromolecular complexation	286
8.2.7 Binding of ions to macromolecules	288
8.2.8 Interaction of polymers with solvents including water	289
8.2.9 Adsorption of macromolecules	291
8.2.10 Polymer crystallinity	293
8.3 Water-insoluble polymers and polymer membranes	293
8.3.1 Permeability of polymers	293
8.3.2 Ion-exchange resins	297

8.4	Details of specific polymers used in pharmacy and medicine	301
8.4.1	Carboxypolymethylene (carbomer, carbopol)	301
8.4.2	Cellulose derivatives	302
8.4.3	Hyaluronic acid, agarose and carrageenan	304
8.4.4	Natural gums and mucilages	305
8.4.5	Dextran	309
8.4.6	Polyvinylpyrrolidone	310
8.4.7	Liquid polymers	312
8.5	Some applications of polymeric systems in drug delivery	313
8.5.1	Release of drugs from matrices	315
8.5.2	Microencapsulation	317
8.5.3	Rate-limiting membranes and devices	319
8.6	Mucus as a polymeric system	321
9	Principles of Drug Absorption and Routes of Administration	325
	Introduction	
9.1	Biological membranes and drug transport	325
9.2	Drug absorption from the gastro-intestinal tract	331
9.2.1	Structural principles of the gastro-intestinal tract	333
9.2.2	Permeability and the pH-partition hypothesis	334
9.2.3	Problems in the quantitative application of the pH-partition hypothesis	337
9.2.4	Bile salts and fat absorption pathways	342
9.2.5	Gastric emptying, motility and volume of contents	344
9.3	Absorption of drugs from intramuscular and subcutaneous injections	345
9.4	Topical preparations	354
9.4.1	Influence of drug	357
9.4.2	Influence of vehicle	361
9.4.3	Dilution of topical steroid preparations	366
9.4.4	Transdermal medication	366
9.5	Medication of the eye	368
9.5.1	The eye	369
9.5.2	Absorption of drugs	371
9.5.3	Influence of formulations	372
9.5.4	Systemic effects from eye-drops	377
9.6	Permeability of the oral mucosa; buccal absorption	377
9.6.1	Mechanism of absorption	378
9.7	Inhalation therapy	379
9.7.1	Physical factors of deposition of aerosols	381
9.7.2	Experimental observations	383
9.7.3	Analysis of particle size distribution in aerosols	388
9.8	The intranasal route	389
9.9	Rectal absorption of drugs	391

10 Drug Interactions and Incompatibilities: a physicochemical viewpoint	401
Introduction	
10.1 pH and other solvent effects	401
10.2 Cation-anion interactions	404
10.3 Simple electrolytes and their effect on drug solutions	406
10.4 Complex formation	406
10.5 Other complexes	412
10.6 Ion-exchange interactions	414
10.7 Adsorption of drugs	415
10.8 pH effects on drug behaviour <i>in vivo</i>	419
10.9 Protein binding	425
10.10 Interaction of drugs with β -cyclodextrin	433
Appendix 10.1: Drug interactions based on physical mechanisms	436
 11 Chemical Stability of Drugs	 445
Introduction	
11.1 The chemical decomposition of drugs	445
11.1.1 Hydrolysis	445
11.1.2 Oxidation	447
11.1.3 Isomerisation	449
11.1.4 Photochemical decomposition	451
11.1.5 Polymerisation	452
11.2 Kinetics of chemical decomposition in solution	453
11.2.1 Order of reaction	453
11.2.2 Zero-order reactions	454
11.2.3 First-order reactions	455
11.2.4 Second-order reactions	457
11.2.5 Third-order reactions	458
11.2.6 Determination of order of reaction	459
11.2.7 Complex reactions	461
11.3 Kinetics of chemical decomposition in solid dosage forms	465
11.4 Factors affecting the rate of chemical decomposition	469
11.4.1 Liquid dosage forms	469
11.4.2 Semisolid dosage forms	479
11.4.3 Solid dosage forms	480
11.5 Stability testing of drugs	483
11.5.1 Effect of temperature on stability	484
11.5.2 Other factors affecting stability	491
Index	495

Preface

This book sets out to provide the physicochemical background to the design and use of pharmaceutical products. It does not cover processing technology as such as this is dealt with adequately elsewhere. Rather an attempt is made to relate the physical chemistry of the drug or drug system to clinical usage. The book deals with the basic situations encountered in the progress of a drug from the dosage form to its site of action and how this can be controlled. Adhesion, deaggregation, solution, rates of solution, stability, diffusion, partition, aggregation, ionisation, interaction with water, and interaction with other molecules are topics which have been tackled. The special problems of the various routes of administration of particular dosage forms are considered from a physicochemical viewpoint, bearing in mind the physiological constraints. Where relevant, the physical chemistry of adjuvant substances such as surface-active agents and polymers has been included as these substances are becoming more widely used to effect changes in the extent or duration of drug activity; often the basic mechanism of their effect is a physical and not a biological one.

Above all, however, an effort is made to unite the physical and biological aspects of pharmaceuticals. Students sometimes forget that the same forces operate in inanimate and animate systems and early on in their training cannot see the relevance of the physical chemistry that is taught. It is hoped that this book will go some way towards bridging the gap between the fundamental and applied aspects of physical chemistry, pharmaceutical chemistry and biopharmaceuticals. It does not purport to be a complete physical chemistry textbook, but should be useful as a textbook which follows on from the standard physical chemistry texts, for use in all years of the undergraduate course. As it is aimed at undergraduates the reference lists at the end of each chapter have been kept to a minimum size. It has frequently been difficult to decide which facts to reference and which not to, but we feel that our approach has been correct. We hope that the book will be of use to undergraduate students of pharmacy and other life sciences and to postgraduate students and practising pharmacists wishing to refresh their memories.

We would be pleased to hear from readers of any errors in our treatment of subjects. It has not been possible to acknowledge by citation of references the contribution of many pharmaceutical scientists who have made this book possible but we nevertheless would have found it impossible to write without recourse to the literature. This is, indeed, one of the reasons why we felt the book was necessary — undergraduate students in pharmacy have had to rely too much on seeking out facts in the original literature. Perhaps this book will ease the way somewhat.
