Preface

The inner magnetosphere is an important region of space plasma because it is one of the “kitchens” for space weather effects. The scientific understanding of this region is important for predicting the interaction between space environmental conditions and human activities.

The inner magnetospheric plasma is a unique composition of different plasma particles and waves. It covers a huge plasma energy range with spatial and time variations of many orders of magnitude. In such a situation, the kinetic approach is the key element, and must be the starting point of a proper theoretical description of these inner magnetospheric plasma phenomena; a book dedicated to this particular area of research is required.

The kinetic theory of the inner magnetosphere has many different aspects and could not be described in one book. This particular book is based on my research and Space Plasma Physics and Advance Plasma Physics courses that I have delivered at different universities of the United States and Russia. The major topics in this book are: Kinetic Theory of Superthermal Electrons, Kinetic Foundation of the Hydrodynamic Description of Space Plasmas (including wave–particle interaction processes), and Kinetic Theory of the Terrestrial Ring Current.

The analytical solutions of simplified transport equations are the distinguishable features of this book. Approximate analytic solutions of transport phenomena are very useful because they help us gain physical insight into how the system responds to varying sources of mass, momentum, and energy and also to various external boundary conditions. They also provide us a convenient method to test the validity of complicated numerical models, a task that is usually tedious and time consuming.

This book provides a broad introduction to the theory of space plasma physics for students who intend to carry out independent research in upper atmospheric science and space physics. It is designed to provide a comprehensive description of the different kinds of transport equations for both plasma particles and waves with an emphasis on the applicability and limitations of each set of equations. It is hoped that this book will provide students and space researchers with an understanding of

how to determine the best approach to any upper atmospheric or space physics problem.

It is my pleasant duty to thank (in alphabetical order) A. A. Chernov, K. V. Gamayunov, G. D. Gefan, T. I. Gombosi, O. A. Gorbachev, V. B. Ivanov, D. V. Khazanov, M. A. Koen, Yu. V. Konikov, J. U. Kozyra, I. A. Krinberg, E. N. Krivorutsky, V. I. Kuzivanov, M. W. Liemohn, E. V. Mishin, T. E. Moore, A. F. Nagy, V. N. Oraevskii, V. M. Polyakov, G. V. Popov, and A. A. Trukhan for the numerous useful discussions, valuable help, and remarks during various stages of the work on the problems considered in this book.

George V. Khazanov

Biographical Sketch

Dr. George V. Khazanov is a senior scientist in the Heliosphysics Science Division at the NASA Goddard Space Flight Center. Prior to joining NASA, he was a Tenured Professor of Physics at the University of Alaska Fairbanks. Dr. Khazanov has extensive experience in space plasma physics and simulation of geophysical plasmas. His specific research areas include: space plasma energization and transport, kinetic theory of superthermal electrons in the ionosphere and plasmasphere, hydrodynamic and kinetic theory of space plasma in the presence of wave activity, theoretical and numerical-modeling investigations of ionosphere-plasmasphere interactions, theoretical studies of the artificial injection of charged and neutral particles into the ionosphere, and wave and beam-induced plasma instabilities in the ionosphere and magnetosphere. Dr. Khazanov was the Dean of the College of Physics, and the Theoretical Physics Department Chair at Altai State University, Russia; Director of the Ionospheric Plasma Physics Laboratory at Irkutsk State University, Russia. He supervised and directed more than 30 M.S. and 15 Ph.D. graduates. He is the author or coauthor of 6 books and about 250 peer reviewed publications.

Book Summary

This book provides a broad introduction to the kinetic theory of space plasma physics with the major focus on the inner magnetospheric plasma. It is designed to provide a comprehensive description of the different kinds of transport equations for both plasma particles and waves with an emphasis on the applicability and limitations of each set of equations. The major topics are: Kinetic Theory of Superthermal Electrons, Kinetic Foundation of the Hydrodynamic Description of Space Plasmas (including wave-particle interaction processes), and Kinetic Theory of the Terrestrial Ring Current. Distinguishable features of this book are the analytical solutions of simplified transport equations. Approximate analytic solutions of transport phenomena are very useful because they help us gain physical insight into how the system responds to varying sources of mass, momentum and energy and also to various external boundary conditions. They also provide us a convenient method to test the validity of complicated numerical models, a task that is usually tedious and time consuming. It is hoped that this book will provide students and space researchers with an understanding of how to determine the best approach to any upper atmospheric or space physics problem.

Contents

1	Introduction	1
1.1	General Overview	1
1.2	Complexity of the Inner Magnetosphere	5
	References	8
2	Kinetic Equations and Particle Collisions	11
2.1	Kinetic and Maxwell Equations	11
2.2	Elastic Collisions	13
2.3	Inelastic Collisions	17
2.4	Plasma Source	20
2.5	Superthermal Electron Kinetic Equation Simplification	24
	References	26
3	General Description of Wave–Particle Interaction Phenomena	27
3.1	Plasma Electrodynamics	27
3.2	Energy of the Electromagnetic Field	31
3.3	Electromagnetic Waves	34
3.4	Dielectric Tensor of Collisionless Plasma	36
3.5	Maxwellian Plasma	41
3.6	Cold Plasma Approximation	43
3.7	Wave Damping and Growth	46
3.8	The Quasilinear Approximation	53
3.9	Nonlinear Drift-Kinetic Equation	56
	References	62
