# Foreword

This book is concerned with 802.11-based wireless networks and their use in emerging vehicular mobility domains. The book is generally concerned with information exchange between vehicles and 802.11-based roadside infrastructure, and lays particular focus on two key research directions: mathematical modeling and handover latency in vehicular communication. The major contributions of this book are focused on the mathematical modeling of vehicular communications—an important and relatively less investigated research area. Since the models developed are based on experimental data, they are capable of portraying real picture of 802.11-based R2V communications. Moreover, the issue of large handover latency has been addressed. This is one of the main hindrances in the widespread use of WLANs from vehicles. In addition to delineating a comprehensive delay analysis of handover, this book introduces a scheme to reduce the delay in the scanning phase of handovers. I sincerely hope that the book will be helpful for graduate, doctoral, and post doctoral researchers.

# Preface

The European Union directive 2010/40/EU defines the Intelligent Transport System (ITS) as a system with advanced applications which, without embodying intelligence as such, aims to improve transport management by increasing coordination and flow of information between on-road vehicles. It has also been envisaged that the application of information and communication technologies (ICT) in the transport sector has a key role in improving efficiency, safety, public security, and freight mobility management of a transportation system. Keeping in view the contribution made by ICT in realizing ITS, the authors have explored the communication mechanism between vehicles to enable various infotainment services.

This book is a result of 3 years of doctoral research focusing on one important aspect of Intelligent Transportation System: the roadside to vehicle (R2V) communications. This research work specifically explores the use of IEEE 802.11 technologies in the R2V scenario. The outcome of this research is also highly relevant in those situations where roadside 802.11 APs are specifically deployed for R2V communications.

Ever since their introduction in the late 1990s, WLAN APs have seen massive deployment across most modern cities. The idea of using already available indoor APs in outdoor vehicular environments has recently come under scrutiny. Although WLAN APs exist in large numbers alongside roads in most developed cities, the placement of these APs is highly unplanned. These WLAN APs cannot support continuous connectivity over a large mobility domain due to their unplanned deployment. Consequently, the network services offered by WLANs are disrupted when used in vehicular environments. While various research works are focused on disruption tolerant networking, this book develops and explores a completely new research direction—developing stochastic models of disruption in 802.11 WLANs and their implications on the vehicular communication systems. Second, a vehicle spends very little time within the AP footprint, most of which is consumed in handing over to the AP. Because of the small outdoor coverage region of the AP and the high speed of the vehicle, handovers inevitably occur frequently. The delay in handing over to these APs is termed as handover latency.

In order to achieve smoother transitions between the APs, the handover latency must be reduced. This book analyzes the latency by measuring various delays incurred during handovers.

This book is written for both mature and early stage researchers including postgraduate and doctoral students. Researchers from other fields interested in vehicular communications can also find this book interesting and informative. The detailed discussion on the prevailing research trends provided here will be useful for both doctoral and post doctoral researchers. This book would also be helpful in courses related to wireless networking since it covers the application of stochastic tools in analyzing communication networks in considerable detail.

The book comprises eight chapters. The basic concepts pertinent to IEEE 802.11 networks, vehicular communications, and challenges associated with 802.11-based vehicular communications have been discussed in [Chap. 1](#). [Chapter 2](#) provides a detailed review of previous research done in vehicular communications. More specifically, the works pertinent to disruption tolerant networking and handover latency have been reviewed. It also introduces some recent IEEE standards that are relevant in vehicular communication. [Chapter 3](#) discusses the measurement results on parameters such as the signal strength and the data rates supported by the indoor APs in vehicular environments. A scheme for monitoring traffic congestion using the existing WLAN infrastructure has also been presented in this chapter.

[Chapters 4–6](#) focus upon the analytical modeling of the disruption tolerant vehicular networks. [Chapter 4](#) provides a 2-state and, next, a 3-state Markov model to compute the long-term error rate as a means of representing disruption. [Chapter 5](#) modifies this model to hidden Markov model and introduces the probabilistic measures of disruption. [Chapter 6](#) contains the application of the proposed model to quantify the benefits of using inter-operator roaming. [Chapter 7](#) discusses the issues related with handovers in the vehicular context. Latency evaluations are provided at the beginning of the chapter followed by a description of the proposed channel scanning scheme to reduce scanning phase delay. The concluding remarks and future works are supplied in [Chap. 8](#) while references and appendices are given at the end of this book.

# Acknowledgments

This book is based on Syed Faraz Hasan's PhD thesis submitted to the University of Ulster.

The authors extend their gratitude to Dr. Allen Sturat (Cardiff University) and Dr. Tom Lunney (University of Ulster) for their insightful reviews on this writing. The authors are also grateful to Dr. Swades De (Indian Institute of Technology) and Dr. Rashid Mehmood (Swansea University) for their comments and support. The authors acknowledge the support received from Dr. Syed Wasim Raza, Dr. Pawan Goyal, Vaibhav Gandhi, and Jennifer Hyndman on various personal and professional matters.

The authors are thankful to their family and friends whose personal support has been instrumental in making this book possible.

# Contents

<b>1</b>	<b>Introduction</b>	1
1.1	802.11 Wireless LANs	2
1.2	Expanding the Mobility Domain of WLANs	4
1.2.1	Vehicular Communications	4
1.2.2	V2V and R2V Communications	5
1.2.3	Wireless Technologies for Vehicular Communications	7
1.3	Challenges in 802.11-Based Vehicular Communications	9
1.4	Summary	11
<b>2</b>	<b>Vehicular Communication: Issues and Standards</b>	13
2.1	Disruption Tolerant Networking	13
2.1.1	Systems and Architectures	14
2.1.2	New and Modified Protocols	17
2.1.3	Prediction-Based Techniques	18
2.2	Handover Latency in Wireless Networks	20
2.2.1	Detection, Search, and Probing Delay	21
2.2.2	Authentication and Address Allocation Delay	23
2.2.3	Handovers in Vehicular Context	24
2.3	IEEE Standards for Vehicular Communication	27
2.3.1	Wireless Access in Vehicular Environments—802.11p	27
2.3.2	Fast Transition—802.11r	28
2.3.3	High Throughput—802.11n	30
2.4	Summary	31
<b>3</b>	<b>Evaluation of WLAN Parameters in Vehicular Setup</b>	33
3.1	Parameters of Interest	34
3.2	Measurement and Analysis	35
3.2.1	Signal Strength	35
3.2.2	Data Rates	38
3.2.3	Correlation Between Data Rates and RSS	42

3.3	Application: Traffic Congestion Monitoring . . . . .	44
3.3.1	Extended MULE Concept . . . . .	45
3.3.2	Roadside Infrastructure . . . . .	47
3.3.3	Communication Mechanism . . . . .	50
3.4	Summary . . . . .	54
<b>4</b>	<b>Markov Model for R2V Communications . . . . .</b>	<b>57</b>
4.1	Markov Models . . . . .	58
4.1.1	Fundamentals of Markov Chains . . . . .	58
4.1.2	Markov Process in R2V Communications . . . . .	60
4.2	Estimating the Transition Probability . . . . .	62
4.2.1	Data Collection . . . . .	62
4.2.2	Probability Distribution of Dataset . . . . .	64
4.2.3	Calculating Transition Probability . . . . .	67
4.2.4	Long-Term Error Rate . . . . .	69
4.3	3-State Markov Model . . . . .	70
4.4	Toward Hidden Markov Model . . . . .	72
4.5	Summary . . . . .	73
<b>5</b>	<b>Measuring Disruption in R2V Communications . . . . .</b>	<b>75</b>
5.1	Hidden Markov Models . . . . .	75
5.2	HMM Representation of R2V Communication . . . . .	76
5.2.1	Model Structure . . . . .	77
5.2.2	Estimating Model Parameters . . . . .	79
5.2.3	Model Generality, Limitations, and Need . . . . .	81
5.3	Observation Sequence of HMM . . . . .	84
5.4	Probabilistic Measures of Disruption . . . . .	88
5.4.1	Forward Algorithm . . . . .	88
5.4.2	State Probability . . . . .	90
5.4.3	Encounter Probability . . . . .	92
5.5	Traffic Pattern Analysis . . . . .	93
5.5.1	Drive Tests . . . . .	94
5.5.2	Variation in Disruption with Traffic Patterns . . . . .	96
5.6	Summary . . . . .	98
<b>6</b>	<b>Inter-ISP Roaming for Vehicular Communications . . . . .</b>	<b>99</b>
6.1	Intra- and Inter-ISP Roaming . . . . .	99
6.2	Wireless Internet Service Provider Roaming . . . . .	102
6.2.1	WISPr Architecture . . . . .	103
6.3	Modifications in HMM . . . . .	105
6.3.1	Effectiveness of WISPr . . . . .	107
6.4	Summary . . . . .	109
