Preface

This monograph is a revised and augmented version of a previous book [24] written in French and published in 2006. Our objective is twofold. First, we want to introduce the reader to the modelling and the mathematical analysis in fluid mechanics. The central models we deal with are the incompressible Stokes and Navier–Stokes equations, whose derivation is exposed in the first chapter. Second, we introduce mathematical tools in a sufficiently general way so that the reader should be able to use them for studying many other kinds of nonlinear evolution partial differential equations.

In this spirit, we tried to make the book as self-contained as possible. The only prerequisites that are needed to begin reading are basic results in calculus, integration, and functional analysis. The second chapter is a recap of more or less standard analysis results that are used in this book. This includes for instance: the definitions and properties of weak and weak- \star convergences in a Banach space, a short introduction to distribution theory, basic compactness results, the Bochner integral and related spaces, basic results in spectral theory, and so on.

In Chapter III, we introduce and study Sobolev spaces on Lipschitz domains of \mathbb{R}^d . The first section contains main definitions and properties of such domains. We describe, in particular, how to define the integral of functions defined on the boundary of such domains and we prove the fundamental Stokes formula. Sobolev spaces are then introduced and thoroughly studied in Section 2. An important role is played (in this chapter but also in the next ones) by suitable mollifying operators that permit us to prove the density of sets of smooth functions in various functional spaces. We also study embedding theorems, extension operators, trace and trace lifting operators, duality theory for Sobolev spaces, and the very important Poincaré and Hardy inequalities. The third section of the chapter is devoted to the introduction of suitable normal/tangential coordinates near the boundary of a sufficiently smooth domain. This framework is useful for the study of tangential Sobolev spaces and thus for the proof of regularity properties, up to the boundary, to solutions of elliptic problems (like the Stokes problem, for instance). All

these notions are illustrated in the last section of the chapter where a complete study of the Laplace problem with Dirichlet or Neumann boundary conditions is given.

Chapter IV concerns the steady (incompressible) Stokes equations. This is a central topic for the study of any model in incompressible fluid mechanics. A basic tool in this theory is the Nečas inequality, a complete proof of which is given in Section 1. This inequality is used in the next section to study relations between the gradient fields and the divergence-free vector fields. This is fundamental in order to build the pressure in the Stokes system. The next two sections are dedicated to particular properties of the divergence and curl operators as well as some related function spaces. The analysis of the Stokes problem with Dirichlet boundary conditions is undertaken in Section 5, which includes the definition of the Stokes operator and application to the unsteady Stokes problem through the semigroup approach. We postponed to Section 6 the complete proof of elliptic regularity properties of the Stokes equations. The last three sections are concerned with some nonstandard variants of the Stokes problem, considering different kind of boundary or interface conditions.

The steady and unsteady Navier–Stokes equations are studied in Chapter V. For the unsteady problem, we prove existence and uniqueness (in 2D) of global weak solutions, we also investigate smoother solutions and discuss the parabolic regularisation properties of the system. Then, for the steady problem, we discuss existence and uniqueness issues in the case of homogeneous and nonhomogeneous boundary data and we deal with very basic stability issues for these solutions.

In Chapter VI, we study the most complex model considered in this book which is the one of the (unsteady) incompressible Navier–Stokes equations for a nonhomogeneous fluid. The first ingredient that is useful in the analysis of this problem is the study of weak solutions for the transport equation. We propose here, in the first section of this chapter, a self-contained exposition of the Di Perna–Lions theory of renormalized solutions for such equations including more recent developments related to the associated trace problem. Those results are then used to prove global existence of weak solutions for the initial- and boundary-value problem associated with the complete Navier–Stokes system in the second section of the chapter.

The final chapter is concerned with two different issues related to boundary conditions arising in numerical simulations of incompressible flows. The first section deals with the problem of outflow boundary conditions that one needs to choose in the case where the computational domain is, for practical reasons, smaller than the real physical domain. We analyse here a nonlinear boundary condition relating normal stress and momentum flux at the outflow boundary. In the second section of the chapter, we study the penalty method which can be used, for instance, to impose a homogeneous Dirichlet boundary condition on the boundary of an obstacle located in a computational domain whose geometry is simple. We prove convergence of the penalised

solution towards the exact solution when the penalisation parameter goes to 0, through the description of a suitable boundary layer. Additionally to their practical interest, the analysis of these two problems gives the opportunity to introduce mathematical methods that the reader may find useful in other contexts.

Contents

Preface	v
Contents	ix
I The equations of fluid mechanics	1
1 Continuous description of a fluid	1
1.1 The continuous medium assumption. Density	1
1.2 Lagrangian and Eulerian coordinates	3
2 The transport theorem	5
3 Evolution equations	7
3.1 Balance equations	8
3.2 Cauchy's stress theorem	11
3.3 Evolution equations revisited	17
4 Fundamental laws: Newtonian fluids and thermodynamics laws	19
4.1 Fluids at rest	20
4.2 Newton's hypothesis	20
4.3 Consequences of the second law of thermodynamics	25
4.4 Equation for the specific internal energy	28
4.5 Formulation in entropy and temperature	29
5 Summary of the equations	30
6 Incompressible models	32
6.1 The incompressibility assumption	32
6.2 Overview of the incompressible models	37
7 Some exact steady solutions	42
7.1 Poiseuille flow in a pipe	43
7.2 Planar shear flow	44
7.3 Couette flow between two cylinders	46
II Analysis tools	49
1 Main notation	50
2 Fundamental results from functional analysis	51

2.1	Banach spaces	51
2.2	Weak and weak- \star convergences	52
2.3	Lebesgue spaces	56
2.4	Partitions of unity	68
2.5	A short introduction to distribution theory	71
2.6	Lipschitz continuous functions	75
3	Basic compactness results	77
3.1	Compact sets in function spaces	77
3.2	Compact maps	79
3.3	The Schauder fixed-point theorem	83
4	Functions of one real variable	84
4.1	Differentiation and antiderivatives	84
4.2	Differential inequalities and Gronwall's lemma	88
5	Spaces of Banach-valued functions	92
5.1	Definitions and main properties	92
5.2	Regularity in time	94
5.3	Compactness theorems	102
5.4	Banach-valued Fourier transform	106
6	Some results in spectral analysis of unbounded operators	110
6.1	Definitions	110
6.2	Elementary results of spectral theory	112
6.3	Applications to the semigroup theory	118
III	Sobolev spaces	121
1	Domains	122
1.1	General definitions	122
1.2	Lipschitz domains	123
2	Sobolev spaces on Lipschitz domains	135
2.1	Definitions	136
2.2	Mollifying operators and Friedrichs commutator estimates	138
2.3	Change of variables	149
2.4	Extension operator	150
2.5	Trace and trace lifting operators	153
2.6	Duality theory for Sobolev spaces	159
2.7	Translation estimates	164
2.8	Sobolev embeddings	167
2.9	Poincaré and Hardy inequalities	179
2.10	Domains of first-order differential operators	184
3	Calculus near the boundary of domains	189
3.1	Local charts description of the boundary	189
3.2	Distance to the boundary. Projection on the boundary	191
3.3	Regularised distance	194
3.4	Parametrisation of a neighborhood of $\partial\Omega$	200
3.5	Tangential Sobolev spaces	206
3.6	Differential operators in tangential/normal coordinates	217

4	The Laplace problem	222
4.1	Dirichlet boundary conditions	222
4.2	Neumann boundary conditions	226
IV	Steady Stokes equations	229
1	Nečas inequality	230
1.1	Proof of the inequality	231
1.2	Related Poincaré inequalities	238
2	Characterisation of gradient fields. De Rham’s theorem	241
3	The divergence operator and related spaces	245
3.1	Right-inverse for the divergence	245
3.2	The space $H_{\text{div}}(\Omega)$	248
3.3	Divergence-free vector fields. Leray decomposition	249
4	The curl operator and related spaces	252
4.1	Poincaré’s theorems	252
4.2	The space $H_{\text{curl}}(\Omega)$	257
4.3	Kernel and image of the curl operator	267
4.4	The div/curl problem	269
5	The Stokes problem	273
5.1	Well-posedness of the Stokes problem	273
5.2	Stokes operator	277
5.3	The unsteady Stokes problem	286
5.4	Penalty approximation of the Stokes problem	287
6	Regularity of the Stokes problem	290
6.1	First degree of regularity	290
6.2	Higher-order regularity	301
6.3	L^q theory of the Stokes problem	302
6.4	Regularity for the div/curl problem	304
7	The Stokes problem with stress boundary conditions	306
7.1	The Stokes–Neumann problem	307
7.2	Regularity properties	311
7.3	Stress boundary conditions	315
8	The interface Stokes problem	323
8.1	Existence and uniqueness	324
8.2	Regularity of the solution	326
9	The Stokes problem with vorticity boundary conditions	329
9.1	Preliminaries	330
9.2	A vector Laplace problem	332
9.3	The Stokes problem	340
V	Navier–Stokes equations for homogeneous fluids	345
1	Leray’s theorem	346
1.1	Properties of the inertia term	346
1.2	Weak formulations of the Navier–Stokes equations	347
1.3	Existence and uniqueness of weak solutions	352

1.4	Kinetic energy evolution	363
1.5	Existence and regularity of the pressure	368
2	Strong solutions	370
2.1	New estimates	371
2.2	The two-dimensional case	373
2.3	The three-dimensional case	376
2.4	Parabolic regularity properties	384
2.5	Regularisation over time	389
3	The steady Navier–Stokes equations	391
3.1	The case of homogeneous boundary conditions	392
3.2	The case of nonhomogeneous boundary conditions	395
3.3	Uniqueness for small data	401
3.4	Asymptotic stability of steady solutions	402
VI	Nonhomogeneous fluids	409
1	Weak solutions of the transport equation	411
1.1	Setting of the problem	412
1.2	Trace theorem. Renormalisation property	413
1.3	The initial- and boundary-value problem	423
1.4	Stability theorem	427
2	The nonhomogeneous incompressible Navier–Stokes equations	434
2.1	Main result	434
2.2	Approximate problem	435
2.3	Estimates for the approximate solution	443
2.4	End of the proof of the existence theorem	447
2.5	The case without vacuum	452
VII	Boundary conditions modelling	453
1	Outflow boundary conditions	454
1.1	Setting up the model	454
1.2	Existence and uniqueness	458
2	Dirichlet boundary conditions through a penalty method	470
2.1	A simple example of a boundary layer	472
2.2	Statement of the main result	476
2.3	Formal asymptotic expansion	479
2.4	Well-posedness of profile equations	492
2.5	Convergence of the asymptotic expansion	497
A	Classic differential operators	507
1	The scalar and vector cases	507
1.1	Definitions	507
1.2	Useful formulas	509
2	Extension to second-order tensors	509

B Thermodynamics supplement 511

1 Heat capacity 512
