

Part III

Reviews of the Sectors

This part presents three sectorial reviews on the production and uses of bioresources, with the aim to pinpoint ample opportunities for valuable activities when sustainable innovations are pursued. First, possibilities for the sustainable production of bioresources in agriculture are shown if sustainable innovations are embraced and supported by policies. Second, ample opportunities for the upgrade of low-value residuals to high-value products (in industries) are presented if R&D can deliver beneficial results because organic, recyclable materials are awarded on markets. The third review presents a few applications of bioresources in services, which underpins the growing consumer demand for natural resources, in particular bioresources which are found, if innovative efforts are focused on market niches.
