SpringerBriefs in Reproductive Biology

More information about this series at <http://www.springer.com/series/11053>

SpringerBriefs in Reproductive Biology is an exciting new series of concise publications of cutting-edge research and practical applications in Reproductive Biology. Reproductive Biology is the study of the reproductive system and sex organs. It is closely related to reproductive endocrinology and infertility. The series covers topics such as assisted reproductive technologies, fertility preservation, in vitro fertilization, reproductive hormones, and genetics, and features titles by the field's top researchers.

Preface

Assisted reproduction has become a very common treatment option for couples dealing with infertility. Despite the successes of these *in vitro* technologies, it is impossible to fully reproduce the *in vivo* environment. Not only are the gametes and embryos exposed to unnatural conditions, but they are also manually manipulated. All of these interventions can lead to the generation of excess reactive oxygen species. Under such conditions, natural antioxidant defences cannot preclude these pathological ROS levels. Ultimately, this leads to the development of oxidative stress which affects gamete survival, fertilization and embryogenesis negatively. It is therefore imperative to find and pursue solutions, such as antioxidant treatment, that may help ameliorate this process.

Antioxidant therapies in ART are written by leaders in the field of oxidative stress in both male and female reproductive medicine. This manuscript aims to bridge the gap between basic research, the role of the embryologist as well as the clinician with regard to antioxidant treatment both *in vivo* and in the ART laboratory. It eloquently covers all aspects of ROS generation (both endogenous and exogenous) as well as the complex interplay of oxidative stress in the ART setting. Various antioxidants and their plausible therapeutic effects to minimize ROS and oxidative stress are also comprehensively discussed.

Contents

1	Introduction.....	1
2	Sources of ROS in ART	3
2.1	In Vivo Generation of ROS	4
2.1.1	In Vivo Generation of ROS in the Male.....	4
2.1.2	In Vivo Generation of ROS in Females.....	7
2.2	In Vitro Generation of ROS in ART	13
2.2.1	Cryopreservation.....	13
2.2.2	Visible Light.....	15
2.2.3	ROS from Gamete Manipulation/ART Technique.....	16
2.2.4	pH and Temperature.....	17
2.2.5	Centrifugation	18
2.2.6	Culture Media	19
2.2.7	Oxygen Concentration	21
3	Antioxidant Strategies	23
3.1	Role of Enzymatic Antioxidants in ART	24
3.1.1	Superoxide Dismutases	29
3.1.2	Catalase	30
3.1.3	Glutathione Peroxidase	31
3.2	Role of Non-enzymatic Antioxidants in ART	31
3.2.1	Vitamin E	32
3.2.2	Vitamin C	33
3.2.3	Melatonin	34
3.2.4	Vitamin B: Folic Acid	35
3.2.5	Coenzyme Q ₁₀	36
3.2.6	L-Carnitine.....	37
4	Role of Combined Antioxidants.....	39
5	Conclusion	41
	References	43

List of Figures

Fig. 2.1	Sources of reactive oxygen species in assisted reproductive technology.	5
Fig. 3.1	Effects of pathological levels of reactive oxygen species in assisted reproductive technology	24
Fig. 5.1	Sources of oxidative stress and interventions to overcome its effects during assisted reproductive technology	42

List of Tables

Table 2.1	Clinical parameters of studies examining reactive oxygen species in follicular fluid in infertile women	9
Table 3.1	Role of antioxidants in ameliorating the effects of oxidative stress in assisted reproduction	25

Authors

Ashok Agarwal is a Professor at the Lerner College of Medicine, Case Western Reserve University and the Head of the Andrology Center and Director of Research at the Center for Reproductive Medicine, Cleveland Clinic, USA. He has researched extensively on oxidative stress and its implications on human fertility and has published over 500 original research articles and reviews. He serves on the editorial boards of several key journals in human reproduction and has edited over 20 medical text books/manuals related to male infertility, ART, fertility preservation, DNA damage and antioxidants.

Ashok's current research interests are the study of molecular markers of oxidative stress, DNA fragmentation and apoptosis using proteomics and bioinformatics tools, as well as fertility preservation in patients with cancer, and the efficacy of certain antioxidants in improving male fertility.

Stefan S. du Plessis is a Professor and the Head of Medical Physiology at Stellenbosch University, South Africa, where he also heads the Reproductive Research Group. His research interests include factors that influence male gamete function and he has published more than 70 scientific articles and book chapters. Dr. du Plessis serves as editorial board member for two leading journals, is an NRF-rated researcher, and is currently a Fulbright Researcher at the Cleveland Clinic's Center for Reproductive Medicine.

Damayanthi Durairajanayagam, Ph.D. is a Senior Lecturer in Physiology at the Faculty of Medicine, MARA University of Technology, Malaysia. She received a Fulbright Scholarship for her research at the Center for Reproductive Medicine, Cleveland Clinic. Her research interests include oxidative stress and the use of proteomics and bioinformatics in studying the molecular markers of oxidative stress in infertile males.

Gurpriya Virk has a Master's in Clinical Embryology from Monash University, Melbourne, Australia. She did her research training at the Center for Reproductive Medicine, Cleveland Clinic. She is interested in investigating the role of oxidative stress in assisted reproduction.
