# Preface

In recent years, numerous variable-structure approaches have been developed for the control of nonlinear dynamic systems and for the model-based estimation of non-measurable states and parameters. These approaches typically make use of first-order as well as higher order sliding mode techniques and related procedures that are characterized by a variable-structure nature. One of their main advantages is the inherent proof of asymptotic stability. This stability proof is either performed offline during the corresponding controller and estimator design or online by the real-time evaluation of a suitable candidate for a Lyapunov function.

The methodological framework for variable-structure control and estimation approaches is quite well developed in the case of continuous-time and discrete-time systems, for which process models are accurately known.

Nevertheless, research efforts are still necessary to make the corresponding procedures applicable when only worst-case bounds are available for specific parameters. This type of uncertainty is often caused by non-negligible, however, inevitable manufacturing tolerances. Moreover, significant stochastic disturbances—for example, as a result of measurement noise—may act as further system inputs in many practically relevant applications. To enhance robustness in such cases, it is possible to combine variable-structure approaches with techniques which are for instance based on interval analysis, stochastic differential equations, or linear matrix inequalities.

This book aims at presenting current research activities in the field of robust variable-structure systems. The scope equally consists in highlighting novel methodological aspects as well as in presenting the use of variable-structure techniques in industrial applications including their implementation on hardware for real-time control.

Besides variable-structure approaches for the design of feedback control strategies and state estimation procedures, computational techniques for simulation—as included in predictive controllers—robustness and stability analysis, as well as for the identification of system models which are characterized by an inherent variable-structure behavior are included. Such models may result from a mathematical representation of state-dependent transitions between various state-space

representations, for example, due to faults of selected system components or due to different system models depending on the current operating conditions of the considered system.

# Acknowledgments

The editors of this special volume on *Variable-Structure Approaches for Analysis, Simulation, Robust Control and Estimation of Uncertain Dynamic Processes* would like to thank all authors for their high-quality contributions. Moreover, we would like to thank all researchers who supported us by reviewing the individual book chapters and by providing invaluable comments and suggestions for improvements. Finally, we would like to thank Prof. Dr. Claus Hillermeier (University of the Federal Armed Forces, Munich, Germany) and Dr. Jan-Philip Schmidt (Springer-Verlag) for supporting our idea to publish this collection of current research articles in the book series *Mathematical Engineering*.

# Contents

<b>Part I Sliding Mode Control for Continuous and Discrete-Time Systems</b>	
<b>Comparison of Backstepping-Based Sliding Mode and Adaptive Backstepping for a Robust Control of a Twin Rotor Helicopter . . . . .</b>	<b>3</b>
Saif Siddique Butt, Hao Sun and Harald Aschemann	
<b>Robust Congestion Controller for a Single Virtual Circuit in Connection-Oriented Communication Networks . . . . .</b>	<b>31</b>
Piotr Leśniewski and Andrzej Bartoszewicz	
<b>Interval Methods for Robust Sliding Mode Control Synthesis of High-Temperature Fuel Cells with State and Input Constraints. . . . .</b>	<b>53</b>
Andreas Rauh and Luise Senkel	
<b>Experimental and Numerical Validation of a Reliable Sliding Mode Control Strategy Considering Uncertainty with Interval Arithmetic . . . . .</b>	<b>87</b>
Luise Senkel, Andreas Rauh and Harald Aschemann	
<b>Part II Sliding Mode State Estimation for Control Purposes</b>	
<b>A Sliding Mode Control with a Bang–Bang Observer for Detection of Particle Pollution . . . . .</b>	<b>125</b>
Manuel Schimmack and Paolo Mercorelli	
<b>Sliding Mode Control for a Hydrostatic Transmission in Combination with a Sliding Mode Observer. . . . .</b>	<b>155</b>
Hao Sun and Harald Aschemann	

<b>Sliding Mode Observation with Iterative Parameter Adaption for Fast-Switching Solenoid Valves . . . . .</b>	189
Tristan Braun and Johannes Reuter	
<b>Sliding Mode Observer for Fault Diagnosis: LPV and Takagi–Sugeno Model Approaches . . . . .</b>	213
Horst Schulte and Florian Pöschke	
<b>Part III Variable-Structure Methods and Models in Control and Estimation</b>	
<b>Sliding Mode State and Fault Estimation for Decentralized Systems . . .</b>	243
Zheng Huang, Ron J. Patton and Jianglin Lan	
<b>Fault Diagnosis of Nonlinear Differential-Algebraic Systems Using Hybrid Estimation . . . . .</b>	283
Dirk Weidemann and Ilja Alkov	
<b>Towards Robust Fault-Tolerant Model Predictive Control with Constraints for Takagi–Sugeno Systems. . . . .</b>	309
Piotr Witczak and Marcin Witczak	
<b>Constrained Model Predictive Control of Processes with Uncertain Structure Modeled by Jump Markov Linear Systems . . . . .</b>	335
