

Socio-Affective Computing

Volume 4

Series Editor

Amir Hussain, University of Stirling, Stirling, UK

Co-Editor

Erik Cambria, Nanyang Technological University, Singapore

This exciting Book Series aims to publish state-of-the-art research on socially intelligent, affective and multimodal human-machine interaction and systems. It will emphasize the role of affect in social interactions and the humanistic side of affective computing by promoting publications at the cross-roads between engineering and human sciences (including biological, social and cultural aspects of human life). Three broad domains of social and affective computing will be covered by the book series: (1) social computing, (2) affective computing, and (3) interplay of the first two domains (for example, augmenting social interaction through affective computing). Examples of the first domain will include but not limited to: all types of social interactions that contribute to the meaning, interest and richness of our daily life, for example, information produced by a group of people used to provide or enhance the functioning of a system. Examples of the second domain will include, but not limited to: computational and psychological models of emotions, bodily manifestations of affect (facial expressions, posture, behavior, physiology), and affective interfaces and applications (dialogue systems, games, learning etc.). This series will publish works of the highest quality that advance the understanding and practical application of social and affective computing techniques. Research monographs, introductory and advanced level textbooks, volume editions and proceedings will be considered.

Foreword

One day, years ago, I unexpectedly found myself several hundred feet below the ocean. My family had been taken from me, and I was hoping that I might be able to find answers deep within a cave riddled with jellyfish and a looming giant octopus. I met an array of sea creatures in otherworldly landscapes. I felt burning curiosity, an inescapable sense of awe and mystery, and indescribable respect for the ocean and the life within. It turns out that my family had been abducted by aliens (we've all been there) who I eventually defeated and returned everyone to safety. Years after I finished playing "Ecco the Dolphin," that experience stayed with me and left a lasting impact. To this day, I have an insatiable love for the ocean and almost became a marine biologist. I was incredibly moved and inspired by my experience with this low-resolution, 16-bit journey.

Art is something that elicits an emotional response – be it music, a painting, a ballet performance, or even video games. Countless modern gamers like myself can tell their own personal story about how they were moved to tears or inspired to action based on a deeply personal experience they had while playing a game.

Video games offer something that almost no other medium can – a two-way dialogue with its participant. A game experience can influence the player and, unlike "conventional" art like paintings, film, or music, the player can influence the experience right back. This two-way street of communication has the power and potential to create an emotional experience that can be more personal, evocative, and effective than any other medium. Furthermore, this dialogue between player and game can become even more powerful when amplified with emerging technologies such as virtual reality, biofeedback, neurofeedback, haptic responses, and whatever new augmentation may be just around the bend.

While this intimate aspect of the "gaming experience" has generally been implicitly understood and casually recognized, the emotional impact and capacity of gaming have only begun to be fully explored and understood.

The chapters within this book examine many of the different and diverse facets of emotion in gaming – what does emotion in gaming even mean, how can it be "accomplished," and why does it all even matter? These are the questions that need

to be answered and the topics that need to be understood before we can boldly go down a path that will open up new ways that games and art, can touch and inspire us to greatness (or, minimally, to become dolphin nerds).

Flying Mollusk, Glendale, CA, USA

Erin Reynolds

Preface

Play constitutes one of our first deliberate activities in life, providing the first opportunity for interaction with objects, devices and other children or grown-ups, months before walking, talking or acquiring advanced tactile abilities. Later on in life, play becomes the basis of forming small or larger groups and identifying rules which need to be respected in order to function within those groups: players of a school basketball team have different roles and competencies, and they all have to work towards the common good of the team, while following the rules of the game, in order to succeed. In this framework, play, especially in social situations, becomes a powerful inducer of emotions, based on its outcome and the dynamics between team members and opponents. In the case of digital games, devices have now the ability to sense player emotion, through cameras, microphones, physiological sensors and player behaviour within the game world, and utilise that information to adapt gameplay accordingly or generate content predicted to improve the player experience and make the game more engaging or interesting.

This book attempts to encompass the concepts that make up the big picture of emotion for and from digital gaming, starting from psychological concepts and approaches, such as modelling of emotions and player experience, to sensing and adapting to emotion, and to discuss applications of emotion-aware gaming in selected concepts and robotics. As work on emotion in games is highly multidisciplinary by nature and important to several areas of research and development, we carefully selected and invited scholars with pioneering work and recognised contributions in game studies, entertainment psychology, affective computing, game design, procedural content generation, interactive narrative, robotics, intelligent agents, natural interaction and interaction design. The result is a **holistic** perspective over the area of emotion in games as viewed by the variant research angles offered by the different research fields. Based on the received chapter contributions, this book is divided in three main parts: *Theory, Emotion Modelling and Affect-Driven Adaptation and Applications*.

Bateman opens the first part of the book (**Theory**) by examining the question of why we like to play in “The Aesthetic Motives of Play”. Kivikangas, in his chapter

titled “Affect Channel Model of Evaluation in the Context of Digital Games”, combines different emotion theories, attempting to explain different aspects of game experience. Finally, Calleja et al. discuss “Affective Involvement in Digital Games” through different dimensions of both involvement and games, aiming to introduce affect in their model and examine how different components of gameplay relate to each other and affect player involvement.

The second part of the book (**Emotion Modelling and Affect-Driven Adaptation**) concentrates on computational concepts related to sensing, emotion modelling and generating emotions and content for digital games. Kotsia et al. in “Multimodal Sensing in Affective Gaming” discuss how different sensing modalities (facial expressions, body movement, physiological measurements or even wearables) can provide meaningful insights about the player’s emotion to the game, based on player expressivity, while Schuller discusses how speech contributes to player-player and player-game interaction in “Emotion Modelling via Speech Content and Prosody – in Computer Games and Elsewhere”. In the framework of brain-computer interfaces and physiology, Fiałek and Liarokapis investigate the use of BCI devices in gaming and virtual reality in “Comparing Two Commercially Available Brain-Computer Interfaces for Serious Games and Virtual Environments” and Yannakakis et al. argue about the importance of physiology for the investigation of player affect in “Psychophysiology in Games”. From the synthesis and generation point of view, Ravenet et al. in “Emotion and Attitude Modelling for Non-player Characters” describe how modelling and generation of emotions and attitudes in embodied conversational agents (ECA) can enhance the realism and interactivity of non-player characters. In a similar framework, Togelius and Yannakakis discuss game level design based on affect and other aspects of player experience in “Emotion-Driven Level Generation”; O’Neill and Riedl present Dramatis, a model of suspense used to generate stories that elicit emotions in “Emotion-Driven Narrative Generation”; Burelli crosses the border of traditional cinematography and digital gaming in “Game Cinematography: From Camera Control to Player Emotions”; and Garner describes how sound in games can be utilised to both infer and evoke emotion in his “Sound and Emotion in Video Games” chapter. This part of the book is concluded with the chapter of Broekens et al. “Emotional Appraisal Engines for Games”; the chapter discusses the rationale for specialised emotional appraisal engines for games which provide basic emotion modelling capabilities for the generation of emotions for non-player characters.

The third part of this book (**Applications**) discusses a number of applications that utilise game- and affect-related concepts. Bianchi-Berthouze and Isbister examine body movement as a means for expressing emotion in the context of digital games (“Emotion and Body-Based Games: Overview and Opportunities”). Holmgård and Karstoft in their “Games for Treating and Diagnosing Post-Traumatic Stress Disorder” chapter discuss the capacity of games for mental health and focus on the impact of emotion on games for post-traumatic stress disorder. Khaled et al. present how emotions were used to model conflict, cooperation and competition in a serious game for children, in “Understanding and Designing for Conflict Learning Through Games”. Finally, robotic applications of emotion and affect are discussed

by R. Aylett in “Games Robots Play: Once More, with Feeling” from the point of view of robotic companions and digitised games, while Cheok et al. present the fascinating concept of “Lovotics: Love and Sex with Robots”.

The editors of this book would like to sincerely thank all contributors for their timely and proactive cooperation and Marleen Moore and all the staff at Springer for their confidence in this project and their support.

Contents

Part I Theory

1	The Aesthetic Motives of Play	3
	Chris Bateman	
2	Affect Channel Model of Evaluation in the Context of Digital Games	21
	J. Matias Kivikangas	
3	Affective Involvement in Digital Games	39
	Gordon Calleja, Laura Herrewijn, and Karolien Poels	

Part II Emotion Modelling and Affect-Driven Adaptation

4	Multimodal Sensing in Affective Gaming	59
	Irene Kotsia, Stefanos Zafeiriou, George Goudelis, Ioannis Patras, and Kostas Karpouzis	
5	Emotion Modelling via Speech Content and Prosody: In Computer Games and Elsewhere	85
	Björn Schuller	
6	Comparing Two Commercial Brain Computer Interfaces for Serious Games and Virtual Environments	103
	Szymon Fiałek and Fotis Liarokapis	
7	Psychophysiology in Games	119
	Georgios N. Yannakakis, Hector P. Martinez, and Maurizio Garbarino	
8	Emotion and Attitude Modeling for Non-player Characters	139
	Brian Ravenet, Florian Pecune, Mathieu Chollet, and Catherine Pelachaud	

9 Emotion-Driven Level Generation 155
Julian Togelius and Georgios N. Yannakakis

10 Emotion-Driven Narrative Generation 167
Brian O’Neill and Mark Riedl

11 Game Cinematography: From Camera Control to Player Emotions 181
Paolo Burelli

12 From Sinewaves to Physiologically-Adaptive Soundscapes: The Evolving Relationship Between Sound and Emotion in Video Games 197
Tom A. Garner

13 Emotional Appraisal Engines for Games 215
Joost Broekens, Eva Hudlicka, and Rafael Bidarra

Part III Applications

14 Emotion and Body-Based Games: Overview and Opportunities..... 235
Nadia Bianchi-Berthouze and Katherine Isbister

15 Games for Treating and Diagnosing Post Traumatic Stress Disorder 257
Christoffer Holmgård and Karen-Inge Karstoft

16 Understanding and Designing for Conflict Learning Through Games 275
Rilla Khaled, Asimina Vasalou, and Richard Joiner

17 Games Robots Play: Once More, with Feeling 289
Ruth Aylett

18 Lovotics: Love and Sex with Robots 303
Adrian David Cheok, David Levy, and Kasun Karunanayaka

Index 329
