

Lecture Notes in Mathematics

Edited by J.-M. Morel, F. Takens and B. Teissier

Editorial Policy for Multi-Author Publications: Summer Schools / Intensive Courses

1. Lecture Notes aim to report new developments in all areas of mathematics and their applications – quickly, informally and at a high level. Mathematical texts analysing new developments in modelling and numerical simulation are welcome. Manuscripts should be reasonably self-contained and rounded off. Thus they may, and often will, present not only results of the author but also related work by other people. They should provide sufficient motivation, examples and applications. There should also be an introduction making the text comprehensible to a wider audience. This clearly distinguishes Lecture Notes from journal articles or technical reports which normally are very concise. Articles intended for a journal but too long to be accepted by most journals, usually do not have this “lecture notes” character.

2. In general SUMMER SCHOOLS and other similar INTENSIVE COURSES are held to present mathematical topics that are close to the frontiers of recent research to an audience at the beginning or intermediate graduate level, who may want to continue with this area of work, for a thesis or later. This makes demands on the didactic aspects of the presentation. Because the subjects of such schools are advanced, there often exists no textbook, and so ideally, the publication resulting from such a school could be a first approximation to such a textbook.

Usually several authors are involved in the writing, so it is not always simple to obtain a unified approach to the presentation.

For prospective publication in LNM, the resulting manuscript should not be just a collection of course notes, each of which has been developed by an individual author with little or no co-ordination with the others, and with little or no common concept. The subject matter should dictate the structure of the book, and the authorship of each part or chapter should take secondary importance. Of course the choice of authors is crucial to the quality of the material at the school and in the book, and the intention here is not to belittle their impact, but simply to say that the book should be planned to be written by these authors jointly, and not just assembled as a result of what these authors happen to submit.

This represents considerable preparatory work (as it is imperative to ensure that the authors know these criteria before they invest work on a manuscript), and also considerable editing work afterwards, to get the book into final shape. Still it is the form that holds the most promise of a successful book that will be used by its intended audience, rather than yet another volume of proceedings for the library shelf.

3. Manuscripts should be submitted (preferably in duplicate) either to Springer’s mathematics editorial in Heidelberg, or to one of the series editors (with a copy to Springer). Volume editors are expected to arrange for the refereeing, to the usual scientific standards, of the individual contributions. If the resulting reports can be forwarded to us (series editors or Springer) this is very helpful. If no reports are forwarded or if other questions remain unclear in respect of homogeneity etc, the series editors may wish to consult external referees for an overall evaluation of the volume. A final decision to publish can be made only on the basis of the complete manuscript, however a preliminary decision can be based on a pre-final or incomplete manuscript. The strict minimum amount of material that will be considered should include a detailed outline describing the planned contents of each chapter.

Volume editors and authors should be aware that incomplete or insufficiently close to final manuscripts almost always result in longer evaluation times. They should also be aware that parallel submission of their manuscript to another publisher while under consideration for LNM will in general lead to immediate rejection.

Preface

In these notes we apply modern methods of classical mechanics to the study of physical systems with symmetries, including, exact or approximate $\mathbf{S}^1 = \text{SO}(2)$ (continuous) symmetries and discrete symmetries. In all cases the existence of a symmetry has profound implications for the dynamical behavior of such systems and for their basic qualitative properties. We are particularly interested in the following qualitative properties

- ▷ The existence and stability of relative equilibria, i.e. orbits of the system that are also group orbits of the \mathbf{S}^1 action.
- ▷ The behavior of periodic orbits near equilibria when the latter change stability, in particular, the Hamiltonian Hopf bifurcation.
- ▷ The topological properties of the foliation of the phase space by invariant tori in the case of completely integrable systems, in particular, monodromy.

Moreover, we are interested in how these basic qualitative features change as the parameters of these systems change, for example, we are interested in the bifurcations of periodic orbits or in the bifurcations of the topology of the integrable foliation of the phase space. I use the term ‘*metamorphosis*’ in order to describe the *ensemble* of all such qualitative bifurcations that happen at certain values of the parameters and which affect the global qualitative picture of the dynamics¹.

We study four systems: the triply degenerate vibrational mode of tetrahedral molecules, the hydrogen atom in crossed electric and magnetic fields, a ‘spherical pendulum’ model of floppy molecules like LiCN and finally the 1: – 2 resonance which can serve as a local approximation of the dynamics near a resonant equilibrium.

As we go through these systems one by one, we see a number of important qualitative phenomena unfolding. In the triply degenerate vibrational mode of tetrahedral molecules we use the action of the tetrahedral group in order to

¹ The first word I thought of in order to describe this notion was the Russian ‘perestroika’. I chose ‘metamorphosis’ after reading the preface of [10].

find the relative equilibria of the system and then we combine this study with Morse theory in the spirit of Smale [115, 116]. One of the families of relative equilibria in this system goes through a linear Hamiltonian Hopf bifurcation that is degenerate at the approximation used.

Hamiltonian Hopf bifurcations are studied in detail in the next two systems: the hydrogen atom in crossed fields and the family of spherical pendula. The main difference between the two systems with regards to the Hamiltonian Hopf bifurcation is that in the hydrogen atom the frequencies of the equilibrium that goes through the bifurcation collide on the imaginary axis and then move to the complex plane. On the other hand, in the family of spherical pendula we have a discrete (time-reversal) symmetry that forces the two frequencies of the equilibrium to be identical. In these two systems we study also the relation between the Hamiltonian Hopf bifurcations and the appearance of monodromy in the integrable foliation.

Ordinary monodromy can not be defined in the $1: -2$ resonance. A generalized notion of monodromy, which can be defined in the $1: -2$ resonance, was introduced in [99]. We describe this generalization, called *fractional monodromy*, in terms of period lattices and we sketch a proof.

I carried out this research as a PhD student at the Université du Littoral in Dunkerque with the support of the European Union Research Training Network MASIE. I would like to thank my supervisor Prof. Boris Zhilinskiĭ of the Université du Littoral for his support during this work.

I am also very grateful to Dr. Dmitriĭ Sadovskii of the Université du Littoral and Dr. Richard Cushman of the Universiteit Utrecht for their advice and guidance during my PhD studies and for encouraging me to publish these notes. Some parts of this volume have been the result of our joint work and I would like to thank them for their kind permission to use here material from our papers [44] and [46].²

² Parts of chapters 2 and 3 have appeared before in the papers [46] and [44] respectively.

Contents

Introduction	1
1 Four Hamiltonian Systems	9
1.1 Small Vibrations of Tetrahedral Molecules	9
1.1.1 Description	9
1.1.2 The 2-Mode	11
1.1.3 The 3-Mode	16
1.2 The Hydrogen Atom in Crossed Fields	17
1.2.1 Perturbed Kepler Systems	17
1.2.2 Description	18
1.2.3 Normalization and Reduction	19
1.2.4 Energy Momentum Map	20
1.3 Quadratic Spherical Pendula	22
1.3.1 A Spherical Pendulum Model for Floppy Triatomic Molecules	22
1.3.2 The Family of Quadratic Spherical Pendula	23
1.4 The 1: - 2 Resonance System	26
1.4.1 Reduction	27
1.4.2 The 1: - 1 Resonance System	30
1.4.3 Fractional Monodromy in the 1: - 2 Resonance System ..	30
2 Small Vibrations of Tetrahedral Molecules	35
2.1 Discrete and Continuous Symmetry	35
2.1.1 The Hamiltonian Family	35
2.1.2 Dynamical Symmetry. Relative Equilibria	37
2.1.3 Symmetry and Topology	40
2.2 One-Parameter Classification	43
2.3 Normalization and Reduction	46
2.4 Relative Equilibria Corresponding to Critical Points	47
2.5 Relative Equilibria Corresponding to Non-critical Points	51

2.5.1	Existence and Stability of the $C_s \wedge T_2$ Relative Equilibria	51
2.5.2	Configuration Space Image of the $C_s \wedge T_2$ Relative Equilibria	54
2.6	Bifurcations	56
2.7	The 3-Mode as a 3-DOF Analogue of the Hénon-Heiles Hamiltonian	57
3	The Hydrogen Atom in Crossed Fields	59
3.1	Review of the Keplerian Normalization	59
3.1.1	Kustaanheimo-Stiefel Regularization	59
3.1.2	First Normalization	60
3.1.3	First Reduction	61
3.2	Second Normalization and Reduction	63
3.2.1	Second Normalization	63
3.2.2	Second Reduction	64
3.2.3	Fixed Points	66
3.3	Discrete Symmetries and Reconstruction	66
3.4	The Hamiltonian Hopf Bifurcations	68
3.4.1	Local Chart	69
3.4.2	Flattening of the Symplectic Form	70
3.4.3	S^1 Symmetry	71
3.4.4	Linear Hamiltonian Hopf Bifurcation	72
3.4.5	Nonlinear Hamiltonian Hopf Bifurcation	75
3.5	Hamiltonian Hopf Bifurcation and Monodromy	77
3.6	Description of the Hamiltonian Hopf Bifurcation on the Fully Reduced Space	81
3.6.1	The Standard Situation	81
3.6.2	The Hydrogen Atom in Crossed Fields	82
3.6.3	Degeneracy	85
4	Quadratic Spherical Pendula	87
4.1	Generalities	87
4.1.1	Constrained Equations of Motion	87
4.1.2	Reduction of the Axial Symmetry	90
4.2	Classification of Quadratic Spherical Pendula	91
4.2.1	Critical Values of the Energy-Momentum Map	91
4.2.2	Reconstruction	94
4.3	Classical and Quantum Monodromy	98
4.3.1	Classical Monodromy	98
4.3.2	Quantum Monodromy	100
4.4	Monodromy in the Family of Quadratic Spherical Pendula	101
4.4.1	Monodromy in Type O and Type II Systems	102
4.4.2	Non-local Monodromy	103
4.5	Quantum Monodromy in the Quadratic Spherical Pendula	104

4.6	Geometric Hamiltonian Hopf Bifurcations	106
4.7	The LiCN Molecule	110
5	Fractional Monodromy in the 1: – 2 Resonance System	113
5.1	The Energy-Momentum Map	113
5.1.1	Reduction	114
5.1.2	The Discriminant Locus	114
5.1.3	Reconstruction	117
5.2	The Period Lattice Description of Fractional Monodromy	119
5.2.1	Rotation Angle and First Return Time	121
5.2.2	The Modified Period Lattice	122
5.3	Sketch of the Proof of Fractional Monodromy in [43]	124
5.4	Relation to the 1: – 2 Resonance System of [99]	125
5.5	Quantum Fractional Monodromy	126
5.6	Fractional Monodromy in Other Resonances	127
Appendix		
A	The Tetrahedral Group	129
A.1	Action of the Group $T_d \times \mathcal{T}$ on the Spaces \mathbf{R}^3 and $T^*\mathbf{R}^3$	129
A.2	Fixed Points of the Action of $T_d \times \mathcal{T}$ on \mathbf{CP}^2	130
A.3	Subspaces of \mathbf{CP}^2 Invariant Under the Action of $T_d \times \mathcal{T}$	131
A.4	Action of $T_d \times \mathcal{T}$ on the Projections of Nonlinear Normal Modes in the Configuration Space \mathbf{R}^3	133
B	Local Properties of Equilibria	135
B.1	Stability of Equilibria	135
B.2	Morse Inequalities and the Euler Characteristic	136
B.3	Linearization Near Equilibria on \mathbf{CP}^2	137
