Part One	1
1 The coupled monsoon system	3
1.1 Introduction	3
1.2 Modeling and predicting monsoon variability	5
1.3 The development of a holistic view of the monsoon	6
1.3.1 Impacts of remote ocean variability on the monsoon	6
1.3.2 Regional ocean variability	15
1.3.3 Impacts of regional ocean variability	15
1.3.4 Intraseasonal variability and the large-scale monsoon	16
1.3.5 Emergence of the concept of the monsoon as a coupled system	18
1.3.6 Emerging questions	22
1.4 Coupled aspects of the monsoon annual cycle	23
1.4.1 Macroscale forcing of the monsoon annual cycle	25
1.4.2 The surface heating–SST tendency paradox	29
1.4.3 The role of ocean dynamics in the annual heat balance of the Indian Ocean	32

1.4.4	Regulation of the annual cycle: an ocean–atmosphere feedback system	35
1.5	Interannual variability of the coupled monsoon system	36
1.5.1	Modes of interannual variability in the monsoon	37
1.5.2	Interannual modes in ocean heat transport.	46
1.5.3	Intraseasonal ocean heat transport	51
1.5.4	Interannual regulation of the monsoon	51
1.6	Coupled aspects of monsoon intraseasonal oscillations	53
1.6.1	The composite MISO.	54
1.6.2	MISO and ocean heat transport.	57
1.6.3	MISO and the onset of the monsoon	61
1.6.4	Intraseasonal variability and the self-regulation of the monsoon system	62
1.7	Holistic theory of monsoon system	63
1.8	Conclusions and some remaining questions.	65
1.9	Acknowledgements.	66
2	The Asian monsoon: Global perspectives	67
2.1	The global setting	67
2.2	Data.	69
2.3	The mean seasonal monsoon-related variations	69
2.3.1	Basic climate variables	69
2.3.2	The atmospheric circulations	71
2.4	Diabatic processes: heat sources and sinks	78
2.5	Regional monsoons	81
2.6	Discussion and conclusions	84
2.7	Acknowledgments	87
3	The Asian winter monsoon.	89
3.1	Introduction	89
3.2	Mean circulations	91
3.2.1	Mid-latitude circulations.	91
3.2.2	Tropical circulations	92
3.3	Severe east Asian winter monsoon weather.	93
3.3.1	Explosive cyclones.	93
3.3.2	Cold surges	94
3.4	Maritime Continent monsoon	102
3.4.1	Annual cycles and seasonal transitions	102
3.4.2	Interactions of cold surges, synoptic disturbances, and MJO	107
3.4.3	Diurnal cycle of convection.	110
3.5	Australian summer monsoon	112
3.5.1	Evolution and intraseasonal variability	112
3.5.2	Triggers of monsoon onset	115
3.5.3	Modulation of synoptic weather.	118

3.6	Interannual variations	118
3.6.1	East Asian winter monsoon	118
3.6.2	Relationship of the Maritime Continent/Australian monsoon with ENSO	120
3.6.3	Long-term variability of Australian summer monsoon	125
3.7	Acknowledgements.	127
Part Two	129
4	Synoptic systems and weather.	131
4.1	Major rainy seasons.	131
4.1.1	Rainy seasons of the Asian monsoon region and the onset of the summer monsoon.	131
4.1.2	The south Asian monsoon region.	134
4.1.3	The east Asian monsoon region.	139
4.2	Synoptic systems	144
4.2.1	The south Asian monsoon region.	144
4.2.2	The east Asian monsoon region.	154
4.3	Tropical cyclones.	164
4.4	Floods and droughts in the monsoon season.	173
4.4.1	The south Asian monsoon region.	174
4.4.2	The east Asian monsoon region.	178
4.5	Cold waves and cold surges.	184
4.6	Local severe storms and mesoscale convective complex events	194
5	Intraseasonal variability	203
5.1	Introduction	203
5.2	General description	206
5.2.1	Madden–Julian Oscillation	206
5.2.2	Boreal summer ISO.	209
5.2.3	High-frequency ISV.	214
5.2.4	Climatological ISO	216
5.3	Synoptic organization and remote influences.	217
5.4	Low-frequency variability	219
5.4.1	Interannual variability	221
5.4.2	Rectification onto low-frequency variability	226
5.5	Theory and physical processes	228
5.5.1	Atmospheric dynamics	228
5.5.2	Air–sea interaction	232
5.5.3	Boreal summer ISO.	237
5.6	Numerical modeling.	242
5.7	Prediction and predictability	246
5.7.1	Empirical models	247
5.7.2	Dynamical forecast models	249
5.7.3	Predictability	250

5.7.4	Real time forecasts	254
5.8	Conclusion	256
5.9	Acknowledgements.	257
6	Interannual variability of the Asian monsoon	259
6.1	Introduction	259
6.2	Principal modes	260
6.2.1	Precipitation	260
6.2.2	Atmospheric circulation	262
6.2.3	Dominant modes associated with major monsoon indices	265
6.3	Dominant impacting factors	268
6.3.1	Sea surface temperatures	268
6.3.2	Land surface process	276
6.3.3	Basic flow and broad-scale climate phenomena	279
6.4	Tropospheric biennial oscillation and the monsoon	280
6.5	Monsoon and global climate variability	287
6.5.1	Role of the monsoon in ENSO and atmospheric teleconnection	287
6.5.2	Asian monsoon and Pacific–American climate.	288
6.6	Summary	292
6.7	Acknowledgments	293
7	The Asian monsoon: Interdecadal variability	295
7.1	Introduction	295
7.2	Interdecadal variability of the south Asian summer monsoon.	296
7.3	Interdecadal variability of the east Asian summer monsoon.	303
7.4	Interdecadal variability of the south Asian winter monsoon.	305
7.5	Mechanism for the interdecadal variability of the ENSO–monsoon relationship	305
7.6	Decadal changes in monsoon intraseasonal activity	315
7.7	Decadal changes in monsoon predictability.	322
7.8	Discussion and conclusion.	323
7.9	Acknowledgments	326
7.10	Appendix	326
7.10.1	Data used and method of analysis	326
Part Three	329
8	Mesoscale processes	331
8.1	Introduction	331
8.2	Convection.	332
8.2.1	Distribution, organization, and structure of tropical convection.	332
8.2.2	Latent heating profiles and the monsoon	336
8.2.3	Cloud populations.	342

8.2.4	Convective momentum transports	344
8.2.5	Diurnal cycle of convection	345
8.3	Topographically forced local circulations	347
8.4	Jets	349
8.5	Surface–atmosphere interactions	352
8.6	Gravity currents and gravity waves	353
8.7	Coastally trapped disturbances	354
8.8	Mesoscale instabilities	355
8.9	Summary and outstanding issues	355
8.10	Acknowledgments	356
9	Large-scale atmospheric dynamics	357
9.1	Introduction	357
9.2	Equatorial waves	358
9.2.1	Equatorial Kelvin wave	359
9.2.2	General dispersion relation	361
9.2.3	Low-frequency equatorial Rossby waves	363
9.2.4	Mixed Rossby–gravity waves	364
9.3	Forced steady motion	364
9.3.1	The wave perspective	364
9.3.2	The vorticity and thermodynamic equation perspective	369
9.4	Monsoon and subtropical anticyclones	371
9.4.1	Winter hemisphere subtropical anticyclone: the effects of mountains	372
9.4.2	Processes determining the summer monsoon and subtropical anticyclones	374
9.4.3	Mechanisms of the summer monsoon and subtropical high	376
9.5	The Tibetan High and the tropical easterly jet	378
9.5.1	Formation and maintenance of the Tibetan High	379
9.5.2	The upper level easterly jet and its impact on the precipitation distribution	379
9.5.3	A possible positive feedback between the Tibetan High/easterly jet and the monsoon convection	380
9.6	Cross-equatorial flow and inertial instability	382
9.6.1	Steady flow in an imposed pressure gradient	382
9.6.2	Inertial instability and the location of the ITCZ	383
9.7	The effects of mean flows on equatorial waves and forced motion	387
9.7.1	The effects of vertical shear on the Rossby wave structure and propagation	388
9.7.2	Extratropical barotropic response induced by equatorial heating	391
9.7.3	Asymmetric Rossby wave response to equatorial symmetric heating	392
9.7.4	Northward propagation of Rossby waves due to monsoon	

	easterly shear	394
9.7.5	Wave energy accumulation in the equatorial westerly duct	395
9.8	Convectively coupled equatorial waves and the tropical intra-seasonal oscillation	395
9.8.1	CISK and wave-CISK	396
9.8.2	Equatorial boundary layer convergence	397
9.8.3	A theoretical model of friction CID for the MJO	399
9.8.4	Dynamics of MJO and monsoon intraseasonal oscillation	400
9.8.5	Roles of atmosphere-ocean interaction and other processes	402
9.9	Teleconnections	403
9.9.1	Rossby wave propagation	403
9.9.2	Rossby wave source associated with tropical convection	404
9.10	Appendix	406
A.1	Vertical modes and shallow-water equations	406
A.2	Equatorial waves	409
A.3	Theoretical model for study of mean flow effects on equatorial waves	411
A.4	A one and a half layer model including interactive diabatic heating	412
9.11	Acknowledgments	415
10	Variation of the Asian monsoon water vapor budget: Interaction with the global-scale modes	417
10.1	Introduction	417
10.2	Theoretical background of the water vapor budget	419
10.3	Contribution of the Asian monsoon to the global hydrological cycle	420
10.3.1	Climatology	420
10.3.2	Temporal variation	423
10.4	Modulation of the water vapor transport and rainfall in the east Asian monsoon region by global modes	434
10.4.1	Diurnal variation	435
10.4.2	Intraseasonal variation	439
10.4.3	Interannual variation	447
10.5	Summary and concluding remarks	454
10.6	Acknowledgements	457
11	Land-atmosphere interaction	459
11.1	Fundamental processes in the seasonal cycle	459
11.2	Land surface quantities controlling monsoons	462
11.3	The connection between the land surface, the atmospheric boundary layer, and cloud/precipitation processes	473
11.4	The possible impact of anthropogenic landuse/land cover changes on the Asian monsoon climate	474

11.5	The feedback processes through the energy and water cycles . . .	475
11.6	Concluding remarks	477
12	Interactions between the Asian monsoon and the El Niño/Southern Oscillation	479
12.1	Air–sea interactions related to ENSO	479
12.2	Precipitation anomalies in the Asian–Australian monsoon region during ENSO events	483
12.3	ENSO-related variability in the Indian Ocean basin	487
12.3.1	Atmospheric and SST anomalies	487
12.3.2	Atmospheric response to anomalous tropical heating . . .	489
12.3.3	Atmosphere–ocean feedbacks in the IO basin	492
12.4	ENSO-related variability over east Asia, Australia and the western Pacific	494
12.5	Evolution of the Philippine Sea anticyclone anomaly	495
12.5.1	Atmospheric preconditions in JJA(0).	495
12.5.2	Synoptic development during PSAC onset	498
12.5.3	Air–sea feedbacks in MAM(1).	499
12.6	Impact of the Asian monsoon on ENSO	500
12.6.1	Effects of the Indian summer monsoon on the development of El Niño	500
12.6.2	Effects of the western North Pacific monsoon on the turnabout of the ENSO cycle	503
12.6.3	Effects of the east Asian winter monsoon in triggering the onset of El Niño.	507
12.7	Discussions and outstanding issues	509
12.7.1	Biennial tendency	509
12.7.2	Interdecadal changes	509
12.7.3	Effects of atmosphere–ocean interaction	510
12.7.4	Effects of atmosphere–land interactions.	510
12.7.5	Roles of intraseasonal oscillations	511
12.8	Acknowledgments	511
13	Effects of the Tibetan Plateau	513
13.1	Introduction	513
13.1.1	The jet stream	514
13.1.2	Warm anticyclone	515
13.1.3	Early progress of Tibetan Plateau research in China . . .	515
13.2	Large-scale features of the atmosphere near the Tibetan Plateau.	517
13.2.1	Large-scale flow and temperature fields	517
13.2.2	Mechanical effects of the Tibetan Plateau on large-scale motion	521
13.2.3	Winter cold surge and the role of the Tibetan Plateau . .	522
13.2.4	Summertime negative vorticity source over the Tibetan Plateau	523

13.3	Heat sources on the Tibetan Plateau	527
13.3.1	Various estimates of heating over the Tibetan Plateau . .	527
13.3.2	Heating over the Tibetan Plateau and the onset of Asian Monsoon.	530
13.3.3	Mechanism of heating	533
13.4	Thermal influences of the Tibetan Plateau on the seasonal transition of circulation and Asian monsoon onset.	539
13.4.1	Sensible heat driven air-pump over the Tibetan Plateau .	539
13.4.2	Thermal impacts of the Tibetan Plateau on seasonal transition and Asian monsoon onset.	542
13.5	Concluding remarks.	546
13.6	Acknowledgements.	549
Part Four	551
14	Seasonal climate prediction of Indian summer monsoon	553
14.1	Introduction	553
14.2	Weather and climate modeling of the monsoon using regional models	556
14.2.1	Limited area models	556
14.2.2	Nested regional models	557
14.2.3	Very high-resolution mesoscale regional models.	558
14.3	Monsoon forecasts using global models	558
14.3.1	Sensitivity to global model resolution	558
14.3.2	Month-long forecasts of monsoonal ISOs and MJOs . . .	559
14.4	Monsoon forecasts and sensitivity to physical parameterization schemes.	565
14.4.1	Land surface processes.	566
14.4.2	Parameterization of the planetary boundary layer	567
14.4.3	Parameterization of cumulus convection	568
14.4.4	Organization of convection and monsoon forecasts	573
14.4.5	Radiative interactions for monsoon modeling	573
14.5	Multimodel forecasts for weather and climate.	574
14.5.1	Performance of multimodels for weather and seasonal climate forecasts	576
14.6	Summary and future work	580
14.7	Appendix 14.1: outline of the FSU global spectral model	582
14.8	Appendix 14.2: definitions of statistical parameters (skill metrics)	582
15	Dynamic seasonal prediction and predictability of the monsoon.	585
15.1	Introduction	586
15.1.1	Historical review.	586
15.1.2	Current dynamic seasonal predictions	587
15.2	Models and experiment.	589
15.3	Limit of seasonal predictability	591

15.4	Potential predictability of various models	595
15.5	Prediction skill after error correction	598
15.5.1	Error correction and verification methods	598
15.5.2	Predictability after error correction	602
15.6	Multimodel potential predictability	605
15.7	Coupled model predictability	608
15.8	Summary and concluding remarks	611
15.9	Acknowledgements	612
Part Five	613
16	Extending the historical record by proxy	615
16.1	Introduction	615
16.2	Internal and external forcing	618
16.3	Tectonic variability	619
16.4	Earth-orbital variability	622
16.4.1	The Indian summer monsoon	622
16.4.2	The east Asian summer and winter monsoons	623
16.5	Centennial and millennial variability	627
16.6	Summary	629
17	Asian monsoons in the future	631
17.1	Introduction: global aspects	631
17.2	Summer monsoon	634
17.2.1	South Asian monsoon	634
17.2.2	East Asian monsoon	640
17.2.3	Monsoon onset	642
17.2.4	ENSO–monsoon relationship	643
17.3	Winter monsoon	644
17.4	Other issues	647
17.5	Summary	649
18	The Asian monsoon – agriculture and economy	651
18.1	Introduction	651
18.2	Variability of rice production in Asia and its relation to variation in rainfall	654
18.2.1	Climatic aspects of rice production	655
18.2.2	Observed variation of rice production: decadal-scale variation	655
18.2.3	Interannual variation of the rice yield and cultivated area	656
18.2.4	Relation between variation of rice production and variation of rainfall	657
18.3	Some facets of the monsoon variability over the Indian region	660
18.3.1	Extremes of seasonal rainfall: droughts and floods	661
18.3.2	Subseasonal patterns of monsoon anomalies	663

18.3.3	Dry spells – breaks in the monsoon	664
18.3.4	Seasonal transitions: onset and retreat.	665
18.4	Role of the monsoon in rice cultivation in the state of Andhra Pradesh in India	668
18.4.1	The impact of local and remote anomalies in seasonal rainfall	668
18.4.2	Impact of the timing of the onset of the monsoon.	670
18.5	Impact of the monsoon on the gross domestic product – the Indian case.	674
18.6	Discussion on the use of meteorological information and predictions for enhancement of agricultural production in a variable climate.	677
18.6.1	Use of ENSO predictions	679
18.6.2	The Indian case	679
18.7	Acknowledgements.	683
Bibliography		685
Index		781

List of figures

1.1	Time sequence of mean annual precipitation for India and north Australia using Indian and north Australian rainfall climatologies	4
1.2	(a) Comparison of the 10-year mean summer precipitation over the Indian Ocean–south Asian region from the AMIP project. (b) Annual cycles of monsoon rainfall over central India from 15 different coupled climate models for the Ganges catchment from the Coupled Model Intercomparison Project (CMIP2).	7
1.3	Wavelet modulus analyses of climate time series of (a) Pacific Ocean SST (1875–1992) in the Niño 3 region, (b) the all-India rainfall index (AIRI) (1875–1992), and (c) the wavelet coherency between the AIRI and the Niño 3 SST	10
1.4	(a) Variability of the monsoon index from 1948–2003. (b) Composites of 850 and 200-hPa zonal winds for strong and weak monsoon seasons over South Asia as defined by the monsoon index. (c) Same as for (b) except for strong and weak north Australian monsoons	
1.5	(a) Intraseasonal variability of precipitation occurs irrespective of the strength of the monsoon. (b; color section) Spatial variability of rainfall for years where the all-India seasonally precipitation averaged was (i) >115%, (ii) approximately normal and, (iii) <90%.	12
1.6	Comparison of the seasonal cycle of zonally averaged northward heat transport in the Indian Ocean.	17
1.7	SST in the Indian and Pacific oceans possesses distinctly different annual cycles of persistence. (a) Persistence of the SST over two six-month periods: summer to winter and winter to summer. (b) Time sequence of the climatological persistence of SST along the equator for a two-year cycle. (c) Persistence with Niño 3 influence removed. (d) Same as (c) but with the ENSO signal removed.	19
1.8	Anomalous state of the Indian Ocean, during November 1997	20
1.9	Mean annual climatology of SST, near-surface wind vectors, and OLR	21
1.10	(a) Mean upper tropospheric temperature for the boreal summer, and boreal winter, averaged between 1979 and 1992. (b) Annual cycle of the mean temperatures. (c) Annual cycle of the mean latitudinal temperature gradients	24
1.11	Time–latitude sections of annual cycle of SST, sea level height, and surface	

xvi **List of figures**

	currents, respectively, using Reynolds (1988) SST data, the TOPEX/POSEIDEN satellite altimeter, and ship-drift.	28
1.12	Time–latitude sections of the annual cycle of 850-hPa zonal wind component, and the heat flux into the north Indian Ocean	29
1.13	(a) Annual cycles of northward ocean heat transport across the equator, the net flux of heat into the north Indian Ocean, and the changes in heat storage in the north Indian Ocean. (b) Latitude–time section of the annual cycle of northward ocean heat transport in the Indian Ocean. (c) Latitude–time section of the annual cycle of the northward flux of latent heat averaged throughout the troposphere	33
1.14	Annual cycle of the energy balance of the north Indian Ocean	34
1.15	Schematic of regulation of the seasonal cycle of the Indian Ocean for the boreal summer and the boreal winter	36
1.16	Differences in 925-hPa wind fields between strong and weak monsoons as defined in Figure 1.4	37
1.17	Schematic of the wind fields along the equator across the Pacific and Indian Oceans during El Niño and non-El Niño periods	38
1.18	Schematic evolution of the biennial component of the monsoon circulation	40
1.19	Time–longitude sections of the SST and the zonal wind anomaly averaged between 5°N and 5°S for the period January 1997 through July 1998	color
1.20	Time–longitude sections of the sea surface height anomalies between 1°N and 1°S, 4°S and 6°S, and 11°S and 13°S, for the period using TOPEX/POSEIDEN altimeter data	color
1.21	Five ten-day average latitude–longitude sections of the sea surface height from mid-November 1997 to early January 1998 using TOPEX/POSEIDEN altimeter data	color
1.22	(a) Characteristics of the IOZM IOD. (b) 10-year sliding correlations of the three indices listed in (a) with each other.	43
1.23	Annual cycle of the monthly Kenyan rainfall vs. a composite of the Kenyan rainfall during El Niño periods.	44
1.24	Composites of the SST anomaly during a positive phase of the IOZM.	color
1.25	Same as Figure 1.24 but for the negative phase of the IOZM	color
1.26	Diagram of the sequence of events in 1997–1998	color
1.27	Composite of the annual variation of the 50 and 200-hPa zonal wind component in the south Asian region for years defined as strong and weak monsoon years (Figure 1.4)	46
1.28	Time series of the components of the north Indian Ocean heat budget for the periods 1969–1973, 1984–1988, and 1994–1998.	47
1.29	Composites of the annual cycle of differences in northward cross-equatorial ocean heat transports between El Niño and La Niña and strong and weak monsoons.	48
1.30	(a) Annually averaged heat budget for the north Indian Ocean. (b) Latitude–time distributions of the annually averaged meridional cross-equatorial heat transports including the long-term seasonal mean. (c) Same as (b) but with the annual average removed.	49
1.31	Power spectra of the cross-equatorial heat transport for periods between 1 and 10 years	50
1.32	Zonally integrated heat flux averaged across the Indian Ocean for 1987 and 1988 which were weak and strong monsoon seasons, respectively	52
1.33	Same as Figure 1.15 except for the regulation of the interannual monsoon	

	system and the impact of an anomalously strong and weak monsoon on the Indian Ocean	53
1.34	(a) Mean PWC (mm) composited for active and break periods of the monsoon over a 15-year period. (b) Intraseasonal variability of the monsoon depicted by the daily satellite microwave sounding unit precipitation product along 90°E plotted against latitude as a function of time for the boreal summers of 1987 and 1988.	color
1.35	Latitude–time sections of MSU satellite precipitation product for the years 1987 and 1988 along 90°E.	54
1.36	Composited satellite derived OLR ($W m^{-2}$) as a function of latitude and longitude from 58 MISOs displayed 20 days before and after maximum prolonged precipitation occurs near the equator in the 75°–85°E longitude band	56
1.37	Spatial plots of the composite evolution of anomalous OLR, SST, and 925-mb wind variability, relative to the composite monsoon intraseasonal oscillation configured from 39 events in the 1985–1995 period.	58
1.38	Ocean response to intraseasonal wind forcing	60
1.39	A schematic of the humidistat feedback showing its three principal phases. . .	61
1.40	Schematic of a general theory of an ocean–atmosphere regulation system for the monsoon and the Indian Ocean	color
2.1	Sea surface temperatures for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	color
2.2	Surface air temperatures for 1961–1990 averaged for JJA, DJF, and their difference JJA – DJF	color
2.3	Sea level pressures for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	color
2.4	Precipitation rate for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	color
2.5	Geopotential height and vector winds at 850 hPa for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	72
2.6	Geopotential height and vector winds at 200 hPa for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	73
2.7	Velocity potential and divergent component of vector winds at 850 hPa for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	74
2.8	Velocity potential and divergent component of vector winds at 200 hPa for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	75
2.9	Vertical p -velocity at 500 hPa for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	color
2.10	Spatial patterns of CEOF1, in which all four seasons were combined, for the divergent velocity from NCEP reanalyses for JJA and DJF corresponding to the vertical structure function of the mass weighted divergent velocity field at the right for 1979–1993	77
2.11	ASR for 1985–1989 averaged for JJA, DJF, and their difference JJA – DJF. .	color
2.12	OLR for 1985–1989 averaged for JJA, DJF, and their difference JJA – DJF. .	color
2.13	Net radiation for 1985–1989 averaged for JJA, DJF, and their difference JJA – DJF	color
2.14	Vertically integrated atmospheric diabatic heating for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	color
2.15	Vertically integrated atmospheric latent heating for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	color
2.16	Divergence of and divergent component of vectors of the vertically integrated	

	total atmospheric energy transports for 1979–2001 averaged for JJA, DJF, and their difference JJA – DJF	color
2.17	<i>For Africa.</i> Regional meridional cross sections of the divergent flow as vectors from 50°S to 50°N from ECMWF for January and July	82
2.18	<i>For Australia–Asia.</i> Regional meridional cross sections of the divergent flow as vectors from 50°S to 50°N from ECMWF for January and July	83
2.19	<i>For the Pacific.</i> Regional meridional cross sections of the divergent flow as vectors from 50°S to 50°N from ECMWF for January and July	84
2.20	<i>For North America.</i> Regional meridional cross sections of the divergent flow as vectors from 50°S to 50°N from ECMWF for January and July	85
2.21	<i>For South America.</i> Regional meridional cross sections of the divergent flow as vectors from 50°S to 50°N from ECMWF for January and July	86
2.22	<i>For the Atlantic.</i> Regional meridional cross sections of the divergent flow as vectors from 50°S to 50°N from ECMWF for January and July	87
3.1	Climatological mean fields in northern winter	color
3.2	Distribution of explosive cyclogenesis during three cold seasons	93
3.3	(a) Daily averaged 500-hPa geopotential height and wind speed for 26 December 2004–2 January 2005. (b) Daily averaged sea level pressure and surface temperature for 26 December 2004–2 January 2005.	98
3.4	The velocity and geopotential response for days 2 and 7 after an imposed pressure forcing at 30°N in an equatorial beta-plane, shallow-water model. . .	100
3.5	Schematic diagram for the progression of an unobstructed edge and an unobstructed front.	101
3.6	Seasonal migration of the monsoon diabatic heat sources during July–February	103
3.7	Monthly mean rainfall and topography for October–March	color
3.8	The annual cycle mode for analyzed station rainfall	104
3.9	Differences of TRMM precipitation radar data and QuikSCAT winds between boreal winter and boreal summer	color
3.10	Monsoon regimes during transition seasons deduced from TRMM precipitation radar rainfall	color
3.11	Composite maps of convective index and 925-hPa winds for no surge and no vortex cases, no surge and vortex cases, surge and no vortex cases, and surge and vortex cases	color
3.12	Evolution of 850-hPa wind and vorticity prior to the formation of Typhoon Vamei, 2001	color
3.13	Composite 850-hPa winds and anomalous OLR for the four phases of the MJO based on time coefficients of an SVD analysis of the winds and OLR	109
3.14	Composite maps of convective indices and 925-hPa winds for MJO and vortex cases when the MJO is in dry, dry to wet, wet, and wet to dry phases	color
3.15	The percentage of days containing a vortex relative to the surge intensity, for all days, days with no MJOs, and MJO days	110
3.16	Vectors that represent the diurnal cycle are computed from hourly CI for December 1998–2001	color
3.17	Monthly mean and standard deviation of the daily averaged CI	111
3.18	First three harmonics of the annual cycle of OLR and 200-hPa winds averaged in the Australian sector	113
3.19	OLR averaged for the north of Australia	114
3.20	Horizontal structure of the gravest mode equatorial Rossby wave over a sequence spanning 21 days.	116
3.21	Onset date each year as a function of the eight phases of the MJO	117

3.22	Time series of EAWM and NAO indices	119
3.23	Simultaneous correlation between Darwin pressure and district rainfall for the four seasons (December–February, March–May, June–August, September–November)	121
3.24	Correlations of 1979–2002 CMAP rainfall with Niño 3 SST	122
3.25	Correlation of Niño 34 SST index with SST and surface winds for the MAM, JJA, SON, and DJF seasons	124
3.26	Australian summertime rainfall trend for the period 1950–2003.	126
4.1	Mean sea level pressure and surface wind distributions over south Asia for July – typical of the summer monsoon season.	138
4.2	Latitude–time section of 5-day mean rainfall over eastern China from April to September averaged for 1961–1990	140
4.3	Onset and ending dates of regional rainy seasons in China	142
4.4	Latitudinal–time cross sections of CMAP rainfall averaged over longitudinal zones of 120°–125°E, 125°–130°E, and 130°–140°E, and rainfall histograms of three regions: Taiwan, Korea, and Japan.	143
4.5	Major synoptic-scale weather systems associated with summer monsoon fluctuations in south Asia.	145
4.6	Number of low-pressure systems which formed over 4° lat/long blocks over the south Asian region in the summer monsoon season during 1888–1983	149
4.7	The decadal frequency of cyclonic disturbances and cyclonic storms over the north Indian Ocean during the period 1899–1999.	150
4.8	(a) A typical sea level pressure pattern in which there are five weather disturbances during the active phase of the monsoon. (b) Typical sea level isobaric pattern over south Asia during a ‘break’ monsoon situation with the monsoon trough lying across the foothills of the Himalayas and a north–south trough along the east coast of India	153
4.9	Mean 850-hpa streamline fields for July, August, September, and October, averaged for 1979–1999	155
4.10	Mean streamline at 850 hpa for summer, for months with many typhoons and for months with few typhoons	156
4.11	Onset and end dates of the Meiyu season over the Yangtze River basin.	159
4.12	Long-term mean rainfall patterns during the Meiyu period: 30-year (1971–2000) mean Meiyu rainfall pattern and the ratio of Meiyu rainfall amount to the mean summer rainfall amount.	160
4.13	Synoptic model of the Meiyu season in east China.	color
4.14	Summer mean 850-hp streamline charts with corresponding CMAP precipitation, and front occurrence frequency within a square of 5° × 5° for 1996–2002 and tropical cyclone occurrence frequency for 1979–2000	161
4.15	500-hPa geopotential height fields of the first stage, (b) the second stage, and the third stage, of the Meiyu period	165
4.16	Annual number of tropical cyclones in the western north Pacific basin.	166
4.17	Track frequency of tropical cyclones in the north-west Pacific.	167
4.18	Locations of initial tropical storm formation and SST anomalies in peak season (July–September) during the six strongest El Niño years and the six strongest La Niña years	169
4.19	The year-to-year departure of monsoon rainfall from its norm over India	174
4.20	Geographical distribution of locations and times of severe floods in China since 1931.	color
4.21	Interannual fluctuation in Meiyu rainfall along the Yangtze River basin	180

4.22	The mean sea level pressure and surface winds over south Asia for January – typical of the winter season	185
4.23	Major tracks of Siberian Highs related to outbreaks of cold air.	191
4.24	The distributions of cloud top blackbody temperature of a MCS generated in a south-west vortex for the period from 1 August to 2 August 1992.	199
5.1	Rainfall variability maps for the global tropics and interannual variation of intraseasonal rainfall variability	204
5.2	Time series of rainfall over India and Australia	205
5.3	Canonical structure of an MJO event based on 5-day average NCEP/NCAR Reanalysis and CMAP rainfall data from 1979–2000	207
5.4	Same as Figure 5.3, except for boreal summer	210
5.5	Seasonal variation of 10–100-day filtered OLR variance	212
5.6	Boreal summer ISO convection life cycle for May–June and August–October	213
5.7	Real and imaginary POPs for an analysis of 10–20-day band-pass filtered OLR data	215
5.8	Hovmoeller diagrams of climatological intraseasonal component of cloud fraction along longitudinal bands of 80°–90°E and 125°–135°E.	216
5.9	Tracks of LPS for the period 1954–1983 during extreme phases of the boreal summer ISO	218
5.10	Composite evolution of 200-hPa velocity potential anomalies associated with the boreal summer ISO and points of origin of tropical systems that developed into hurricanes/typhoons	220
5.11	Interannual variations of MJO activity based on a number of different indices and Niño 3 SST variability.	222
5.12	May–July 500-hPa vertical velocity MJO index during 1958–2001, the OLR MJO index during 1979–2001, and May–July mean Niño 3.4 SST anomaly during 1958–2001	224
5.13	Lag correlations between OLR and surface fields	233
5.14	Time series of wind stress, latent heat flux, short-wave radiation, long-wave radiation, net surface heat flux, precipitation, and SST for TOGA COARE on 22 October 1992 through to 2 March 1993	235
5.15	Time–latitude sections of 10–80-day filtered anomalies of OLR, windspeed, net surface heat flux, and SST averaged over 85°–90°E in the summer of 1998	239
5.16	Wavenumber–frequency power spectra of north–south propagation characteristics of rainfall from longitude range 65°E–95°E from a CGCM, the corresponding AGCM using SSTs specified from the CGCM simulation, and CMAP rainfall data	240
5.17	Standard deviation of 20–90-day filtered rainfall for Boreal from the CMAP observations for 1979 to 1998 and for ten AGCMs	244
5.18	Composite ISO events in terms of rainfall from observations and seven AGCMs for the boreal summer	color
5.19	ISO predictability vs. lead time for 200-hPa velocity potential and rainfall averaged over the region 4°N–24°N and 72.5°E–132.5°E	252
5.20	Signal-to-noise ratio of 30–90-day filtered precipitation and 200-hPa velocity potential predictions averaged over all four phases of three ISO events	253
6.1	Climatology (1979–2002) of seasonal means and standard deviations of CMAP precipitation for DJF, MAM, JJA, and SON.	261
6.2	(a)–(d) First EOF modes of U200 for DJF, MAM, JJA, and SON based on the NCEP/NCAR reanalysis for 1968–2003. (e)–(h) Differences in U200 between	

	strong and weak Asian summer monsoon for the previous DJF and MAM, concurrent JJA, and following SON	263
6.3	Spatial patterns and corresponding time coefficients of wind and SST anomalies	color 263
6.4	Patterns of regression of JJA 850-mb winds and precipitation against various monsoon indices	267
6.5	Patterns of differences in Niño 3.4 SST of respective seasons and in JJA 850-mb winds between warm and cold cases	271
6.6	JJA differences in land–sea surface temperature, precipitation, 500-mb geopotential height, and 200-mb winds	275
6.7	Schematic diagram showing the fast response of the hydrologic and energy cycles and the influence of large-scale circulation induced by slowly varying forcing in the atmosphere–land coupling over the east Asian monsoon region.	276
6.8	Pattern of differences in May–September 200-mb winds between experiment A and experiment B with a NASA general circulation model	278
6.9	Difference in the previous DJF U200 between a strong and a weak Asian monsoon in the summer.	280
6.10	Lag correlation of Indian summer monsoon rainfall with SST along 5°S–5°N and surface winds along 6	281
6.11	Schematic illustration of an ocean–atmosphere mechanism for the TBO and for a land–atmosphere mechanism in which soil moisture acts like SST.	283
6.12	Schematic diagram illustrating the interactive processes leading to TBO with an emphasis on the remote SST effect	color 283
6.13	Schematic diagram illustrating the TBO features associated with anomalies of convective activity, SST, surface winds, extratropical circulation, and equatorial Indian and Pacific Ocean thermocline orientations	286
6.14	DJF stationary wave activity flux for a strong east Asian jet stream, a weak jet stream, and the difference between the strong and weak jet streams.	290
6.15	Regression of the principal component of the first mode of North America summer rainfall against 500-mb geopotential height and 850-mb winds and 200-mb velocity potential and divergent winds.	291
6.16	Regression of the principal component of the second mode of North America summer rainfall against 500-mb geopotential height and 850-mb winds and 200-mb velocity potential and divergent winds.	292
7.1	Interannual and interdecadal variability of three Indian summer rainfall indices and summer SST over Niño 3	297
7.2	Spatial distribution of rainfall anomalies within the Indian continent during two contrasting interdecadal epochs	299
7.3	Interdecadal variation of June–September maximum surface temperature and minimum surface temperature over India together with that for AIR.	300
7.4	Interdecadal variability of interannual variance of normalized AIR and JJAS Niño 3 SST using a 15-year moving window	301
7.5	21-year moving correlation between AIR and JJAS Niño 3 SST and lag correlations between AIR and monthly mean SSTAs over the Niño 3 region	302
7.6	Interannual and interdecadal variability of the EASM rainfall over two areas in China.	304
7.7	Interannual and interdecadal variability of two Indian winter rainfall indices and winter SST over the EQIO and over Niño 3	306
7.8	(a) Climatological seasonal mean precipitation and vector wind at 850 hPa. (b) Climatological JJAS mean MH circulation constructed with meridional velocity	

and vertical pressure velocity averaged between 70°–100°E. (c) Same as (b) but with anomalous meridional and vertical pressure velocity during an active condition. (d) Frequency distribution of normalized 10–90-day filtered precipitation anomalies during 1 June–30 September for 6 strong monsoon years averaged over the monsoon trough region. (e) Same as in (d) but for anomalies averaged over the equatorial Indian Ocean. 307

7.9 Spatial pattern obtained by regressing global SST and global SLP on low-pass filtered AIR and Niño 3, respectively 309

7.10 Spatial pattern of the first combined EOF of low-pass filtered fields of SST, precipitation, and vector winds at 850 hPa. 311

7.11 Continuation of spatial pattern of the first CEOF of low-pass filtered fields for vector winds at 200 hPa, velocity potential at 200 hPa, and time evolution of PC1 for CEOF1 in arbitrary units 312

7.12 MH and equatorial Walker circulation associated with the interdecadal mode 313

7.13 MH and equatorial Walker circulation associated with the interannual ENSO mode during northern summer 314

7.14 Climatological mean ISO activity during northern summer 317

7.15 Amplitude of IAV of ISO activity. 318

7.16 Low-pass filtered interannual standard deviation of ISO activity averaged over 40°–100°E, 10°–35°N of zonal winds at 850 hPa and relative vorticity at 850 hPa together with PC1 of the interdecadal mode scaled down by a factor of 5.1 319

7.17 Spatial pattern of the first EOF low-pass filtered vertical pressure velocity at 500 hPa and time evolution of the PC1 320

7.18 (a) Variation of predictability index of relative vorticity at 850 hPa and vertical pressure velocity at 500 hPa averaged over the Indian summer monsoon region based on an 11-year moving window together with the PC1 of the interdecadal mode. (b) Variation of predictability index of relative vorticity at 850 hPa and vertical pressure velocity at 500 hPa averaged over the central Pacific based on an 11-year moving window together with the PC1 of the interdecadal mode. (c) 11-year running mean of ISO activity of zonal winds at 850 hPa and vertical pressure velocity at 500 hPa over the central Pacific 321

8.1 Six-year TRMM merged precipitation annual climatology color

8.2 MCC locations based on 1980s satellite data for JJA in the northern hemisphere and DJF in the southern hemisphere. 333

8.3 Schematic reflectivity drawing of idealized life cycles for three linear MCS archetypes: TS, LS, and PS 334

8.4 Schematic depiction of four main categories of convective structures for given vertical shears in the lower troposphere and at middle levels based on COARE observations, but modified to include results from SCSMEX. 335

8.5 Idealized mature stage of MCS illustrating convective and stratiform precipitation areas along with associated heating profiles 336

8.6 Forty-day mean vertical distributions of areal mean vertical *p*-velocity, heating rate, and drying rate for Region I, Region II, Region III, and (d) Region IV. 338

8.7 TRMM Precipitation Radar estimates of total rain, convective rain, stratiform rain, and stratiform rain fraction based on 2.5° grid averages for 1998–2000 . color

8.8 Rigid-lid solutions for perturbations of *u*, *w*, *p*, and buoyancy *b* for superposition of *n* = 1 and 2 modes 341

8.9 Conceptual model of tropical cumulus cloud distributions from 30°N to 30°S based on COARE mean radar data and thermal stratification. 343

8.10	Time–latitude plot of IR brightness temperatures averaged over the South China Sea between 110°E and 120°E for 1 May to 30 June 1998.	color
8.11	Diurnal cycle of accumulated cloudy area covered by the 208 K cloud clusters over the domain of 10°N–10°S, 152°E–180° for each of the four class sizes . .	347
8.12	Mean QuikSCAT wind for DJF and JJA	color
8.13	1985–1999 SST climatology along with QuikSCAT wind vectors and stress magnitude	349
8.14	Latitude–time section of cloud cover frequency along 90°E for August 1998 .	350
8.15	Regions where low-level jets are known or suspected to occur with some regularity and where mesoscale convective complexes are known to occur frequently during the summer.	350
8.16	Diurnal wind oscillations at Hong Kong and Dongsha Island during SCSMEX	351
8.17	<i>Aqua</i> satellite image of cloud lines, closed cells, and vortex streets over the East China Sea on 15 January 2003 during a cold air outbreak	color
8.18	January–March SST climatology over the Yellow and East China Seas, along with: bottom depth; velocity and divergence of QuikSCAT wind; and TMI cloud liquid water	color
8.19	Locations of a cold front at hourly intervals on 7–8 January 1996.	354
9.1	Vertical structures of the vertical pressure velocity for the first four internal modes computed for an isothermal atmosphere in which the static stability parameter is proportional to the inverse of the pressure squared	360
9.2	Horizontal structures of the equatorial wave solution to the shallow-water equations on equatorial β -plane for equatorial Kelvin wave $k = 1$, $n = 1$ Rossby wave $k = -1$, $n = 2$ Rossby wave $k = -1$, and $n = 0$ Rossby–gravity wave $k = -1$	361
9.3	Dispersion curves for equatorial waves in a resting basic state as a function of non-dimensional zonal wavenumber k and frequency ω	362
9.4	Gill’s solution for heating symmetric about the equator and heating antisymmetric about the equator.	366
9.5	Gill’s solution for asymmetric heating which is the sum of the heatings shown in Figure 9.4(a) and (b).	368
9.6	Schematic diagram showing response of the tropical atmosphere to an imposed deep cumulus heating: initial tendency and equilibrium solution. If the heating were located in the southern hemisphere, the resultant flows would be a mirror image.	370
9.7	Schematic diagram showing the upper level circulation induced by both an imposed heating and the corresponding compensated cooling outside of the heating region: initial tendency and equilibrium solution.	371
9.8	Schematic diagrams depicting the adiabatic interaction between the zonally averaged flow and an idealized mountain based on the linear theory in which isentropes do not intersect the mountain in the zonal plane and the non-linear theory in which isentropes can intersect the mountain in the zonal plane . . .	373
9.9	June–August mean 887-hPa streamfunctions	375
9.10	The upper tropospheric Tibetan High and easterly jet at 200 hPa and associated divergence, and the lower tropospheric winds at 850 hPa and mid-tropospheric vertical pressure velocity	color
9.11	Schematic diagram showing the forces acting on a parcel of air under the influence of a cross-equatorial pressure gradient.	386
9.12	Meridional structures of the geopotential field for baroclinic and barotropic Rossby wave mode calculated using an equatorial β -plane	389

9.13	Horizontal structure of the $n = 1$ Rossby waves with a wavelength of 10,000 km	390
9.14	The low-level wind response to an equatorially symmetric heat sink simulated using an anomaly atmospheric general circulation model with specified basic states of boreal summer mean and boreal winter mean climatological flow . . .	393
9.15	Schematic diagram showing the mechanism by which an easterly vertical shear of the mean flow generates a northward propagation component for moist Rossby waves	395
9.16	Horizontal structures of the equatorial Kelvin wave and the most trapped equatorial Rossby wave in the presence of boundary layer damping	398
9.17	Schematic diagram for the Madden–Julian Oscillation in the tropical atmosphere	399
9.18	Schematic diagram for stationary Rossby waves from a point source filling a circle when the ray path is in the eastward direction	404
9.19	Schematic diagram for teleconnections between the tropics and higher latitudes caused by propagation of stationary Rossby waves along great circle ray paths	405
9.20	Schematic diagram showing the generation of rotational motion when tropical convection occurs in upper level easterlies	407
10.1	The global hydrological cycle	421
10.2	Variance of global precipitation fluctuations	424
10.3	Temporal variations of hemispheric mean P and $\nabla \cdot Q$ and global mean precipitation P_G	425
10.4	Power spectra of P_G , P_A , and P_E time series shown in Figure 10.3	426
10.5	Same as Figure 10.1(b) except for the maximum and minimum phase of the diurnal cycle	427
10.6	Intraseasonal variations of $P_{(\cdot)}$ and $(\nabla \cdot Q)_{(\cdot)}$	430
10.7	Phase of 30–60-day mode and 12–24-day mode defined in terms of \hat{P}_A and \hat{P}_A time series	432
10.8	Same as Figure 10.1(b), except for 30–60-day mode and 12–24-day mode	434
10.9	Same as Figure 10.1(b), except for the interannual ENSO mode	436
10.10	Composite charts of (χ_Q, P) every three hours	437
10.11	Enlarged regional composite charts of (χ_Q, Q, P) anomalies in the Asian monsoon hemisphere every three hours extracted out of the corresponding global composite charts in Figure 10.10	439
10.12	Maximum phase of the P diurnal cycle expressed in terms of UTC and LST	441
10.13	$y-t$ diagrams of various P anomalies at 120°–125°E and power spectra of δP anomalies	442
10.14	Summer composite charts of $(\tilde{\chi}_Q, \tilde{P})$ and $(\hat{\chi}_Q, \hat{P})$ anomalies based on phases defined by \tilde{P}_A and \hat{P}_A indices shown in Figure 10.7	443
10.15	Composite charts of $\tilde{\psi}_Q$ anomalies in the east Asian region for all eight phases of the 30–60-day cycle corresponding to those shown in Figure 10.14(a)	445
10.16	Same as Figure 10.15, except for six phases of the 12–24-day mode of $\tilde{\psi}_Q$ before and after the Asian monsoon break, and the $y-t$ diagram of $\tilde{\psi}_Q$ in the 1999 summer before the monsoon break, and in the 1999 summer after the break	447
10.17	The $x-t$ diagram of $\Delta(\chi_Q, P)$ anomalies and time series of Δ SST (Niño 3.4) (JJA)	449
10.18	The eastward propagation of summer $\Delta(\chi_Q, P)$ anomalies is illustrated by the warm-cold-warm ENSO cycle (1982–1987)	450
10.19	The $y-t$ diagram of lagged correlation coefficients $r_{\Delta P_A \cdot \Delta u(850)_{140 \text{ deg E}}}$ between ΔP_A and $\Delta u(850 \text{ mb})_{140 \text{ deg E}}$, and $r_{\Delta P_A \cdot \Delta P_{140 \text{ deg E}}}$ between ΔP_A and $\Delta P_{140 \text{ deg E}}$	451

10.20	Composite cycle of warm and cold extreme summers (condensed from Figure 10.17) determined by ΔP_A	452
10.21	Composite charts of $\Delta(\psi_Q, P)$, $\Delta(\psi_Q, N_{FT})$, and $\Delta(\psi_Q, N_{TC/TD})$ over four phases of the extreme warm–cold summer cycle	453
11.1	Difference of climatological mean height and U , V field for May values minus April values. Dashed line shows negative values.	460
11.2	Schematic of the circulation between the desert region of North Africa and the Near East; and the subtropical ocean regions and the precipitating part of the monsoon circulation, respectively	461
11.3	Longitude–vertical cross sections for May showing mean heating rate Q_1/c_p and drying rate Q_2/c_p for the 30°–40°N latitudinal band through the Tibetan Plateau. Dark (light)	color
11.4	Autocorrelations of monthly SST anomalies in the northern Pacific, sea ice in the Arctic Sea, snow cover over Eurasia, geopotential height at 700 hPa, and NDVI in the Sahel region, North Africa	462
11.5	Schematic diagram for the albedo feedback and the hydrological feedback of snow cover during the seasonal march from winter to summer	464
11.6	Year-to-year variations of the AIMR and ESSC	465
11.7	Latitude–time sections showing (a) mean (1966–1990) seasonal evolution of the surface temperature along a longitude of 30°–60°E. (b) The same as in (a), except for 850 hPa horizontal wind obtained from ECMWF reanalysis (1980–1990). (c) The same as in (a), but for static stability γ between 850 and 700 hPa.	466
11.8	(a) Lag one autocorrelation values of soil moisture for the months of June, July, and August (JJA) for SMI. (b) Potential evaporation for JJA in SMI	468
11.9	The land–atmosphere coupling strength diagnostic for boreal summer, averaged across the 12 models participating in GLACE	color
11.10	(a) Simulation of the seasonal variation in the net radiation and latent heat over an evergreen forest and rainfall interception in 1998 and 1999. (b) The cumulative result	470
11.11	Time series for the daily net ‘all-wave’ radiation and the ground heat flow, the sensible heat flux and the latent heat flux, and the Bowen ratio	471
11.12	Changes of seasonal precipitation for south/south-east Asia and east Asia for different boundary conditions	473
11.13	Observed rainfall trend during 1950–1990 in August and September and rainfall difference in August and September computed between vegetated condition and deforested condition	color
11.14	The two major feedback loops in the perturbed region: moisture convergence feedback and evaporation feedback.	475
12.1	(a) Distribution of the warm-minus-cold composites of SST, SLP, and surface wind vector during DJF(0/1), as computed using observational data sets for ten warm and ten cold ENSO events. Time series of areal averages of anomalies of (b) SST in the central equatorial Pacific, (c) SLP in the vicinity of Tahiti and Darwin, and (d) surface zonal wind over the western equatorial Pacific	color
12.2	Schematic representing the spatial structures of the delayed oscillator mode during El Niño	482
12.3	Distributions of the warm-minus-cold composites of precipitation during JJA(0), SON(0), DJF(0/1), MAM(1) and JJA(1), as computed using GPCP data for the warm ENSO events of 1982, 1991 and 1997 and the cold events of 1988 and 1998.	484
12.4	Areal averages of precipitation anomalies during six selected warm ENSO	

	events and six cold events, for India–Arabian Sea in JJA(0); and for southern China–East China Sea, the Philippine Sea, and northern Australia, all in DJF(0/1)	486
12.5	Distributions of the warm-minus-cold composites of 850-hPa vector wind and SST fields, for JJA(0), SON(0), and DJF(0/1)	color
12.6	Distributions of wind response in the lower troposphere to cooling in the Maritime Continent and western Pacific, as simulated by a linear stationary wave model with specified 2-D basic state for JJA and DJF	491
12.7	Distributions of the differences between the outputs from the MLM and CTRL experiments for the warm-minus-cold composites of SST, 850-hPa vector wind, and precipitation, for DJF(0/1), MAM(1), and JJA(1)	color
12.8	Distributions of the warm-minus-cold composites of surface wind vector and SST, and SLP and precipitation	color
12.9	Time–longitude distributions of the warm composites of SLP and SST, as computed by averaging NCEP data and output from the MLM experiment over the zonal belt between 10°N and 20°N	496
12.10	Distributions of the warm-minus-cold composites of the anomalous 850-hPa vector wind; 200-hPa vector wind; 500-hPa height and precipitation; and surface air temperature	497
12.11	Distributions of the composite patterns of surface wind vector, SLP, and precipitation, for the time periods of T_o , $T_o + 2$ pentads, and $T_o + 4$ pentads, where T_o corresponds to the pentad when the SLP field over the South China and Philippine Seas makes a distinct transition to an anticyclonic pattern . . .	color
12.12	Distributions of the differences between the outputs from the MLM and CTRL experiments for the warm-minus-cold composites of SLP and precipitation, for MAM(1)	499
12.13	Distributions of the linear regression coefficients vs. the south Asian monsoon rainfall index of zonal wind along the equatorial zonal plane and zonal wind stress	502
12.14	Time series of SST and atmospheric anomalies in the WNP during the six strongest warm episodes in the 1950–2003 period	504
12.15	Distributions of the monthly mean local rate of change of subsurface ocean temperature in a vertical section along the equator during the turnabouts of the warm events of 1982–1983 and 1991–1992	505
12.16	Spatial patterns and temporal coefficients of the first and second EOF modes of the winter mean air temperatures at 925 hPa in the 1948–2002 period	508
13.1	Orography of Tibetan Plateau	color
13.2	January and July mean stream fields at 200 hPa, 500 hPa, and 1,000 hPa, and the mean temperature fields averaged from 200–500 hPa based on the NCEP/NCAR reanalysis and averaged over the period from 1958 to 1997	518
13.3	January and July mean cross sections of potential temperature and vertical circulation along 30°N and 90°E	520
13.4	1980–1997 July mean cross sections of geopotential height deviation from the corresponding zonal mean along 30°N and along 90°E	524
13.5	The July mean PV budget at the $\sigma = 0.4357$ level and at the $\sigma = 0.995$ level. .	526
13.6	Vertically integrated heat source $\langle Q_1 \rangle$ and moisture sink $\langle Q_2 \rangle$, averaged for 1979–1993 for December–February and June–August	531
13.7	Annual cycles of the 1979–1993 mean vertically integrated heat source $\langle Q_1 \rangle$ and moisture sink $\langle Q_2 \rangle$ over the western Tibetan Plateau and over the eastern Tibetan Plateau	532

13.8	(a) Longitude–height sections of the 1979–1993 mean apparent heat source Q_1 for DJF, MAM, JJA, and SON, averaged between 27.5°N and 37.5°N. (b) Similar to (a), but for the 1979–1993 mean apparent moisture sink Q_2	534
13.9	(a) Latitude–height sections of the 1979–1993 mean Q_1 for DJF, MAM, JJA, and SON, averaged between 70°E and 100°E. (b) Similar to (a) but for the 1979–1993 mean Q_2	536
13.10	Time–latitude sections of the 1979–1993 mean $\langle Q_1 \rangle$, $\langle Q_2 \rangle$, and upper tropospheric temperature, averaged over 70°–100°E	538
13.11	July mean area-averaged profiles of the total diabatic heating rate and its components over the Tibetan Plateau region; middle Asia region; and east China region.	539
13.12	The difference of July mean stream field at 200 hPa between the experiments of CON and NSH, and the simulation results of the seasonal evolutions of the zonal wind u and the ridge line of the subtropical anticyclone along 90°E in the experiments CON and NSH	541
13.13	Distributions in different months of the ridge lines of the subtropical anticyclone at 700 hPa, 500 hPa, and 200 hPa averaged from 1980 to 1997.	543
13.14	The projection of the subtropical anticyclone ridge line at the levels from 850 hPa to 200 hPa during the season transition (from the third pentad of April to the second pentad of June) (a) 11–15 April, (b) 16–20 April, (c) 21–25 April, (d) 26–30 April, (e) 1–5 May, (f) 6–10 May, (g) 11–15 May, (h) 16–20 May, (i) 21–25 May, (j) 26–31 May, (k) 1–5 June, (l) 6–10 June.	545
13.15	The time lag correlation coefficients between the monsoon onset over the eastern part of the BOB and the monthly mean 200-hPa geopotential height	547
14.1	120-hour forecasts of streamlines at 850 hPa using a global model at varying horizontal resolutions of T21, T31, T42, T63, T106, and T170	559
14.2	(a) Observed 24-hour rainfall; (b) 72-hour forecast of 850-hPa flow field with superimposed accumulated rainfall using a global model at T255 resolution	color
14.3	Time history of the zonal wind at 850 hPa along 68°E from the anomaly experiment using the FSU global model at T21 resolution	561
14.4	(a) A sequence of 850-hPa observed flow fields for the experiment on a dry spell over India. (b) Same as (a) but for predicted fields	562
14.5	Anomaly correlations of forecasts as a function of days of forecasts for the globe and tropics.	564
14.6	The 850-hPa flow field for 17 June 1979	570
14.7	r.m.s. error skill and anomaly correlation of precipitation forecasts at day 1 and day 2 of forecasts from the FSU Global Spectral Model at T170 resolution, using different cumulus convection parameterization schemes, Unified Convection Scheme, and the Superensemble	572
14.8	Various skill scores for the Asian summer monsoon region from different member models, their ensemble mean, and the superensemble.	577
14.9	(a) r.m.s. errors and anomaly correlation of precipitation forecasts for different years for 7 DEMETER models, ensemble mean of the 7 DEMETER models, synthetic ensemble mean, and for the synthetic superensemble. (b) Same as (a) but for the suite of 4 FSU coupled models	color
14.10	An example of the seasonal forecast of precipitation for a relatively wet monsoon year	color
15.1	Variances of summer mean precipitation anomalies for the 21-year period (1979–1999)	592
15.2	(a)–(e) External variance of precipitation based on the ensemble average of each	

	year. (f)–(j) Internal variance based on the deviation of individual members from the ensemble average. (k)–(o) Signal-to-noise ratio defined by the ratio of the forced variance to the free variance	594
15.3	(a) The spatial distribution of the limit of correlation skill estimated by using the SNU AGCM. (b) Same as in (a) except for the perfect model correlation.	596
15.4	Zonal mean distribution of theoretical limit of correlation skill for five models in the northern hemisphere.	596
15.5	(a)–(e) Variance of the systematic error – the difference between the ensemble average of prediction and the corresponding observation. (f)–(j) Ratio between the variances of ensemble mean and systematic error	597
15.6	Distribution of the correlation coefficient between the observed and simulated ensemble mean precipitation at each grid point	color
15.7	Pattern correlation coefficients between the observed and predicted precipitation over the monsoon region	599
15.8	(a) Composite SST anomalies for the years of good monsoon prediction. (b) Those for the years of poor monsoon prediction	600
15.9	EOF modes of the observed and simulated ensemble mean precipitation	603
15.10	As in Figure 15.5 except the predicted precipitation of the SNU SMIP after correction of the systematic error using SVD and PDS.	604
15.11	Pattern correlation coefficients between the observed and predicted precipitations of the SNU SMIP before and after the bias correction by the SVD and PDS over the monsoon region	605
15.12	Distribution of r_M and $R_{\text{Best}} - R_M$, which are computed using five-model precipitation data	606
15.13	Time series of the spatial pattern correlations over the monsoon region between the observed and the predicted precipitations of MME1, MME2, and MME3.	607
15.14	Lead-lag correlation coefficient between pentad rainfall and SST averaged over the western North Pacific.	609
15.15	Local correlation coefficients between JJA rainfall and SST	color
15.16	Correlation coefficient of summer mean SST for the multimodel composite and the individual models in a tier-one system of DEMETER.	color
15.17	Correlation coefficient of summer mean precipitation for the multimodel ensemble and the individual models in a tier-one system of DEMETER.	color
15.18	The interannual variation of the averaged value of pattern correlation of the individual DEMETER models before and after the bias correction over the monsoon region	610
16.1	Climate change at orbital timescales; external forcing, internal boundary conditions, and monsoon climate change over the past three million years	616
16.2	Climate change at millennial timescales	617
16.3	Coherence and phase relationships between the Indian summer monsoon, solar insolation, and global ice volume over the past 350,000 years	color
16.4	Indian summer monsoon phase wheels for precession and obliquity.	624
16.5	Asian winter monsoon phase wheels for eccentricity and obliquity.	626
17.1	(a) Trend of the annual mean surface air temperature calculated as an ensemble mean of the 11 GCMs. (b) Standard deviation of the trend of the annual mean surface air temperature among 11 GCMs	632
17.2	As in Figure 17.1 except for the annual mean precipitation.	633
17.3	(a) JJA mean surface air temperature change between 2071–2100 and the present-day simulation (1971–2000) by the MRI-CGCM2. (b) JJA	

	precipitation change. (c) JJA precipitation change as a ratio to the present value. (d–f) As in (a–c) except for DJF	635
17.4	JJA mean precipitation in south Asia for the control and the $2 \times \text{CO}_2$ case of the NCAR model	636
17.5	(a) Seasonal cycle of precipitation averaged over land for $60^\circ\text{--}100^\circ\text{E}$, $10^\circ\text{--}30^\circ\text{N}$. (b) As in (a) except for zonal winds at 850 hPa and 200 hPa averaged for $40^\circ\text{--}110^\circ\text{E}$, $5^\circ\text{--}20^\circ\text{N}$	637
17.6	(a) JJA mean 850-hPa wind and its magnitude and (b) JJA mean column integrated moisture flux and its convergence in the present-day simulation by the MRI-CGCM2. (c, d) As in (a, b) except for the change between 2071–2100 and the present simulation (1971–2000) by the MRI-CGCM2	638
17.7	(a) Time series of the June–September precipitation anomalies in south Asia and its 11-year running mean of the IS92a run by the ECAHM4/OPYC3 CGCM. (b) Sliding variance of (a) using an 11-year window in the IS92a run and control run. (c, d) As in (a, b) except for the Niño 3 SST.	639
17.8	Onset dates of the rainy season	color
17.9	Observed and simulated changes in 31-year sliding window correlations between Indian monsoon rainfall and Niño 3 SST anomalies (JJA)	644
17.10	Variations of the Asian winter monsoon index defined as the DJF mean northerly wind averaged at $15^\circ\text{--}40^\circ\text{N}$, $115^\circ\text{--}130^\circ\text{E}$ in the ECHAM4/OPYC3 CGCM IS92a experiment.	645
17.11	(a) As in Figure 17.10 except for the MRI-CGCM2 SRES-A2 experiment. (b) Time series of DJF mean surface northerly wind over the South China Sea in the MRI-CGCM2 SRES-A2 experiment	646
17.12	(a) DJF mean surface wind and its magnitude in the present-day simulation by the MRI-CGCM2. (b) As in (a) except for the change between 2071–2100 and the present simulation (1971–2000) by the MRI-CGCM2	647
18.1	Yearly losses in Philippine rice production and their causes, 1968–1977	652
18.2	All-India summer monsoon rainfall anomalies and all-India summer foodgrain production during 1966–1994	654
18.3	Annual rice production in major rice-growing countries during 1961–1993	color
18.4	Variation of normalized annual rice production, area, and yield in the major rice-growing countries of Asia during 1961–1993	color
18.5	Frequency distribution of the change in yields from one year to the next for different countries	color
18.6	Frequency distribution of the change in area under rice cultivation from one year to the next for different countries	color
18.7	Change in yield from one year to the next vs. change in area from one year to the next for India and Thailand	657
18.8	(a) Relationship between year-to-year changes in rice yield and those in May–October rainfall over India. (b), (c), and (d) – same as (a) but for Thailand, the Philippines, and Indonesia, respectively	658
18.9	Variation of all-India summer monsoon rainfall anomalies during 1871–2004.	color
18.10	31-year running means and standard deviations of all-India summer monsoon rainfall using the data period 1871–2004	661
18.11	Extreme ISMR anomaly represented in the phase plane of the EQUINOO index and the ENSO index	663
18.12	Daily variation of all-India summer monsoon rainfall during the recent drought year of 2002	666
18.13	(a) Superposed-epoch composites of daily rainfall variation relative to the	

	summer monsoon onset over south Kerala. (b) The frequency distribution of the onset dates of the south-west monsoon over south Kerala in three-day intervals for the period 1891–1990	667
18.14	Andhra Pradesh state of India and its meteorological subdivisions.	669
18.15	Interannual variation of the total Kharif rice production in Andhra Pradesh and summer monsoon rainfall in the three meteorological subdivisions of the state.	color
18.16	Correlation between various rice production parameters in Andhra Pradesh and the monthly/seasonal monsoon rainfall of the three meteorological subdivisions	color
18.17	Spatial patterns of correlation between various rice production parameters over Andhra Pradesh and seasonal rainfall over the peninsular of India	671
18.18	(a) Spatial patterns of correlation between kharif rice production in Andhra Pradesh and monthly rainfall during the monsoon season over the Indian peninsula. (b) Same as (a) but for rabi rice.	672
18.19	Variation of the agricultural component of the Indian GDP	675
18.20	Variation of the percentage contribution of agriculture to the Indian GDP	676
18.21	Variation of the Indian GDP	677
18.22	(<i>top</i>) Departure of the observed GDP from the fitted GDP normalized by the fitted GDP vs. the ISMR anomalies normalized by the average ISMR for each year. (<i>bottom</i>) Departure of the observed GDP–agriculture from the fitted GDP–agriculture normalized by the fitted GDP–agriculture vs. the ISMR anomalies normalized by the average ISMR for each year	678
18.23	Summer monsoon rainfall anomaly patterns during the two recent El Niño years of 1997 and 2002	color
18.24	Relationship between rainfall during the rainy season and yield of maize, sorghum, and millet at 15 dryland locations in India	680
18.25	Variation of rice production anomalies with the variation of rainfall anomalies during May–October for the three subdivisions of Andhra Pradesh	681
18.26	Simulated and observed peanut yield vs. July–December rainfall for the Anantapur district of Andhra Pradesh	681
18.27	Daily rainfall at Anantapur during July to December in 1989 and 1995. Note that although the seasonal total rainfall is almost the same, the simulated yields are very different.	682

18.3	Correlations between monthly and seasonal ISMR.	664
18.4	Subseasonal patterns of extreme ISMR anomalies	664

Preface

The Asian monsoon is a spectacular occurrence in the Earth's climate system. During summer, the monsoon engine pumps moisture transported across thousands of miles from the Indian and Pacific Oceans, producing heavy rains over south and east Asia and adjacent marginal seas; meanwhile, it dumps sinking, dry air to the north and west of Asia's monsoon area, forming the World's largest desert zone, which stretches from the Sahara and the Middle East to Mongolia. During winter, the Siberian cold wave pushes airflow across the equator, causing heavy rains over Indonesia, northern Australia, and the southern Pacific convergence zones.

What makes the Asian monsoon so powerful is the combination of thermal contrast between the World's largest landmass (Eurasian continent) and ocean basin (the Indo-Pacific Ocean) and the presence of the World's largest ridge, the Tibetan Plateau. This unique tectonic setting responds to seasonal progression of the solar radiation and Earth's rotation, producing the *monsoon climate* with its seasonal reversals in both the prevailing winds and associated precipitation, characterized by "wet" summers and "dry" winters. Positive feedback with hydrological processes amplifies the monsoon circulation. The accompanying desert and the Mediterranean climate over the subtropics are "twin" to the monsoon climate, as both are produced by the Asian monsoon system.

The giant Asian monsoon system (often called the Asian–Australian monsoon system) dominates the entire eastern hemisphere tropics and subtropics. It interacts with the El Niño/Southern Oscillation (ENSO) and extratropical circulations and has far-reaching impacts for the global climate and the environment. The Asian monsoon exemplifies the most complex interactions among Earth's surface, ocean, atmosphere, hydrosphere, and biosphere. The scientific importance of the Asian monsoon cannot be overemphasized.

The Asian monsoon is also of enormous importance to humans. About 60% of humanity inhabits the region of the Asian monsoon – a region where torrential rains,

storms, droughts, heat waves, and cold-air surges are a part of the economy, culture, and rhythms of life. The vegetation, biogeochemistry, economy, and society across the Asian monsoon regions are all critically influenced by the evolution and variability of the Asian monsoon.

The science pertaining to the monsoon has advanced enormously in the last two decades due to an increased wealth of new data from satellite observations and field experiments, and the advances in computing power and mathematical representations of coupled climate systems. My intent in compiling this book is to offer a timely summary of recent progress and also the remaining gaps in our knowledge and to provide a full and current account of scientists ever-improving, expanding understanding of the physics associated with monsoon weather and climate. Particular attention is given to the rapid progress made in monsoon predictions, some possible directions for future change, and the monsoon's impacts on economies.

In view of the topic's complexity and scientific diversity, leading scientists at the forefront of monsoon research were invited to contribute to this book. Most chapters contain an authoritative review of the subject and highlight conceptual breakthroughs as well as frontier research issues.

This volume begins with an overview of the Asian monsoon (Part One: Chapters 1–3). Chapter 1 describes the Asian monsoon as a multiscale, coupled atmosphere–ocean–land dynamic system that interacts with other components of the Earth's climate system. Chapter 2 provides a global perspective of the monsoon. Chapter 3, complementing other chapters, focuses on the most powerful boreal winter monsoon and Austral summer monsoon over the Maritime Continent and Australia; providing a comprehensive overview of the monsoon in general and the Asian–Australian monsoon in particular.

The character of the monsoon system is highly variable on many temporal and spatial scales. Part Two (Chapters 4–7) describes the monsoon variability over a broad range of timescales, from days to decades, and on various spatial scales, from the smallest mesoscale to continental and global scales. The great variety of monsoon weather is described in Chapter 4, with a detailed account of both south Asian and east Asia. Chapter 5 provides a comprehensive review of the current knowledge and issues of the monsoon's intraseasonal variations. In Chapter 6 is summarized the main features of interannual variability and possible causes. Variability on the decadal to interdecadal timescale is addressed in Chapter 7.

Understanding of the monsoon climate and its changes represents one of the most difficult challenges to climate science because of the complexity of its interactions over a wide range of atmospheric processes, as well as associated interactions between the atmosphere, ocean, and land. Part Three of this book (Chapters 8–13) is devoted to better improving the understanding of the monsoon system's physical processes and its roles associated with the Earth's climate system. This part looks at the atmospheric internal dynamical processes on a mesoscale (Chapter 8) and on large and planetary-scales (Chapter 9). Hydrological processes are also discussed (Chapter 10). Also included in this part are the interactions of the monsoon system with land surface processes (Chapter 11), and ENSO–Asian monsoon interactions (Chapter 12), and as well the roles of the Tibetan Plateau (Chapter 13). These

chapters, along with the discussions on the atmosphere–ocean interaction discussed in Chapter 1, lay out a firm basis for understanding the complex monsoon physics.

Seasonal prediction of monsoon activity is vitally important for society and remains a foremost challenge to climate prediction in the 21st century. Part Four (Chapters 14–15) deals with the numerical modeling and prediction of the monsoon activity. The governing dynamical controls and physical representations that determine the potential predictability of monsoons are explored in Chapters 14 and 15. Although the dynamical models of the coupled ocean–atmosphere–land system still have considerable difficulty in capturing the predictability, the discussions in this part of the book offer new ideas that are expected to contribute to noticeable improvements in the monsoon climate predictions in the coming decades.

Part Five of the book (Chapters 16–18) enhances the understanding of the monsoon environment and its societal influences. Evidence from paleorecord studies shows that the Asian monsoon system has undergone remarkable changes on geological timescales. Chapter 16 gives a detailed account of the past monsoon cycles according to geological, orbital, and millennial and centennial timescales. In the future, anthropogenic influences, including landuse/cover changes and atmospheric composition changes on regional and global scales, may considerably affect the future of the Asian monsoon. Possible human influences on the Asian monsoon are discussed in Chapter 17. The focus of Chapter 18 is on the monsoon's impacts on agriculture and the economy. Of note is the fact that the monsoon's influences on humanity reach far beyond agriculture – these aspects are dealt with more specifically elsewhere.

This book can be used as a comprehensive interdisciplinary text for college students, both undergraduate and graduate. It can also serve as a professional reference for research scientists and professionals in the fields of meteorology, oceanography, climate dynamics, environmental science, geography and geology, hydrology, paleoclimatology, agriculture, and the social sciences. Its informative content is such that most material in this book can also be of great value to non-specialists.

Chapter 5 **Duane E. Waliser**

Jet Propulsion Laboratory, MS 183-505, California Institute of Technology, 4800
Oak Grove Drive, Pasadena, CA, 91109, USA

Email: duane.waliser@jpl.nasa.gov

Chapter 6 **Song Yang¹ and William K.-M. Lau²**

¹NOAA's Climate Prediction Center, Camp Springs, Maryland 20746, USA

²NASA Goddard Space Flight Center, Laboratory for Atmospheres, Greenbelt, MD, 20771, USA

Email: song.yang@noaa.gov, lau@climate.gsfc.nasa.gov

Chapter 7 **B. N. Goswami**

Centre for Atmospheric and Oceanic Sciences, Indian Institute of Science, Bangalore, 560012, India

Email: goswamy@caos.iisc.ernet.in

Chapter 8 **Richard H. Johnson**

Colorado State University, Department of Atmospheric Science, Fort Collins, CO 80523, USA

Email: johnson@atmos.colostate.edu

Chapter 9 **Brian J. Hoskins¹ and Bin Wang²**

¹Department of Meteorology, University of Reading, PO Box 243, Earley Gate, Reading, RG6 6BB, UK

²Department of Meteorology and International Pacific Research Center, University of Hawaii at Manoa, 2525 Correa Road, Honolulu Hawaii 96822, USA

Email: B.J.Hoskins@reading.ac.uk, wangbin@hawaii.edu

Chapter 10 **Tsing-Chang Chen**

Department of Geological and Atmospheric Sciences, 3010 Agronomy Hall, Iowa State University, Ames, IA, 50010, USA

Email: tmchen@iastate.edu

Chapter 11 **Tetsuzo Yasunari^{1,2}**

¹Hydrospheric atmospheric Research Center (HyARC), Nagoya University, Nagoya, Aichi 464-8601, Japan

²Frontier Research Center for Global Change (FRCGC), JAMSTEC, Yokohama, Kanagawa

Email: yasunari@atm.geo.tsukuba.ac.jp

Chapter 12 **Ngar-Cheung Lau¹ and Bin Wang²**

¹Geophysical Fluid Dynamics Laboratory/NOAA, Princeton University, Princeton, New Jersey, USA

²Department of Meteorology and, International Pacific Research Center, University of Hawaii at Manoa, 2525 Correa Road, Honolulu, Hawaii 96822, USA

Email: gl@gfdl.gov, wangbin@hawaii.edu

Chapter 13 **Michio Yanai¹ and Guo-Xiong Wu²**

¹Department of Atmospheric and Oceanic Sciences, University of California, Los Angeles, 405 Hilgard Avenue, Los Angeles, California 90095-1565, USA

²State Key Laboratory of Atmospheric Sciences and Geophysical Fluid Dynamics (LASG), Institute of Atmospheric Physics, Chinese Academy of Sciences, PO Box 9804, Beijing 100029, China

Email: yanai@atmos.ucla.edu, gxwu@lasg.iap.ac.cn

Chapter 14 **T. N. Krishnamurti¹, T. S. V. Vijaya Kumar¹, and A. K. Mitra²**

¹Department of Meteorology, Florida State University, Tallahassee, FL 32306-4520 USA

²National Centre for Medium Range Weather Forecasting, New Delhi, India

Email: tnk@io.met.fsu.edu, vijay@met.fsu.edu

Chapter 15 **In-Sik Kang¹ and Jagadish Shukla²**

¹Center for Climate and Environment Study, School of Earth Science, Seoul National University, Seoul 151-742, Korea

²Institute of Global Environment and Society, Inc., George Mason University, 4041 Powder Mill Road, Suite 302, Calverton, MD 20705-3106, USA

Email: kang@climate.snu.ac.kr, shukla@cola.iges.org

Chapter 16 **Steve C. Clemens**

Earth Systems History, Department of Geological Sciences, Brown University, 324 Brook Street, Box 1846, Providence, RI, 02912, USA

Email: steven_clemens@brown.edu

Chapter 17 **Akio Kitoh**

Climate Research Dept., Meteorological Research Institute, 1-1 Nagamine, Tsukuba, Ibaraki 305-0052, Japan

Email: kitoh@mri-jma.go.jp

Chapter 18 **Sulochana Gadgil¹ and K. Rupa Kumar²**

¹Center for Atmospheric and Oceanic Sciences, Indian Institute of Science, Bangalore 560012, India

²Climatology and Hydrometeorology division, Indian Institute of Tropical Meteorology, Pune 411008, India

Email: sulo@caos.iisc.ernet.in, kolli@tropmet.res.in

Abbreviations

ABL	atmospheric boundary layer
AGCM	atmospheric general circulation model
AIMR	all-India monsoon rainfall
AIR	all-India rainfall
AIRI	all-Indian rainfall index
AIRS	Atmospheric Infrared Sounder
AMIP	Atmospheric Model Intercomparison Project
AMTEX	Air Mass Transformation Experiment
ANOVA	analysis of variance
AO	Arctic Oscillation
APCN	APCE Climate Network
APEC	Asia–Pacific Economic Cooperation
ARMEX	Arabian Sea Monsoon Experiment
ARPS	Advanced Regional Prediction System
ASCII	Air–sea Convective Intraseasonal Interaction
ASR	absorbed solar radiation
AUS	northern Australian region
AV	absolute vorticity
AWMI	Asian winter monsoon index
BATS	biosphere–atmosphere transfer scheme
BMRC	Bureau of Meteorology Research Centre
BOB	Bay of Bengal
BOBMEX	Bay of Bengal Monsoon Experiment
C-POL	C-Band Polarimetric Radar
CAPE	convective available potential energy
CCA	canonical correlation analysis
CCCMA	Canadian Centre for Climate Modeling and Analysis
CCM	Climate Community Model

CCSR	Center for Climate System Research
CEOF	complex empirical orthogonal function
CGCM	coupled general circulation model
CHI	southern China and East China Sea region
CI	convection index
CID	convective interaction with dynamics
CINE	convective inhibition negative energy
CISK	conditional instability of the second kind
CISO	climatological ISO
CLIVAR	Climate Variability and Predictability Programme
CMAP	Climate Prediction Center Merged Analysis of Precipitation
CMIP	Coupled Model Intercomparison Project
CNRM	Centre National de Recherches Meteorologiques
CO ₂	carbon dioxide
COADS	Comprehensive Ocean–Atmosphere Data Set
COARE	Coupled Ocean–Atmosphere Response Experiment
CODAS	comprehensive ocean–atmosphere data set
COLA	Center for Ocean–Land–Atmosphere Studies
CPC	Climate Prediction Center
CRIEPI	Central Research Institute of Electric Power Industry
CRU	Climatic Research Unit
CSE	continental-scale experiment
CSIRO	Commonwealth Scientific and Industrial Research Organization
CSM	Climate System Model
CTRL	control experiment
CZ	Cane–Zebiak model
DEMETER	Development of a European Multimodel Ensemble system for
DERFs	Dynamical Extended Range Forecasts
DJF	December–January–February
DO	Dansgaard–Oeschger
DOE	Department of Energy
DTEP	deep tropical eastern/central Pacific
EAH	East African Highlands
EAM	east Asian monsoon
EASM	east Asian summer monsoon
EAWM	east Asian winter monsoon
ECMWF	European Centre for Medium-Range Weather Forecasts
ENSO	El Niño/Southern Oscillation
EOF	empirical orthogonal function
EQIO	equatorial Indian Ocean
EQUINOO	Equatorial Indian Ocean Oscillation
ERBE	Earth Radiation Budget Experiment
FCL	free convection level
FFT	fast Fourier transform
FGGE	First GARP Global Experiment

FRCGC	Frontier Research Center for Global Change
FSU	Florida State University
FSULAM	Florida State University Limited Area Model
GAME	GEWEX Asian Monsoon Experiment
GARP	Global Atmospheric Research Program
GATE	GARP Atlantic Tropical Experiment
GCM	general circulation model
GDP	Gross Domestic Product
GEWEX	Global Energy and Water Cycle Experiment
GFDL	Geophysical Fluid Dynamics Laboratory
GHG	greenhouse gas
GISP2	Greenland Ice Sheet Project 2
GISS	Goddard Institute for Space Studies
GLA	Goddard Laboratory for Atmospheres
GLACE	Global Land Atmosphere Coupling Experiment
GMS	geostationary meteorological satellite
GOALS	Global–Ocean–Atmosphere–Land–System
GOOS	Global Ocean Observing System
GP	genesis potential
GPCP	Global Precipitation Climatology Project
HadAM3	Hadley Centre Atmospheric Model version 3
HFP	Historical Forecast Project
HMR	homogeneous region monsoon rainfall
HUBEX	GAME–Huaihe Basin Experiment
HyARC	Hydrospheric Atmospheric Research Center
HYCOM	HYbrid Coordinate Ocean Model
IAP	Institute of Atmospheric Physics
IAV	interannual variability
IIOE	International Indian Ocean Expedition
IMD	India Meteorological Department
IND	India/Arabian Sea region
INDOEX	Indian Ocean Experiment
INSAT	Indian National Satellite
IO	Indian Ocean
IOD	Indian Ocean Dipole
IOP	Indian Ocean Panel; Intense Observing Period (Chapter 8)
IOZM	Indian Ocean Zonal Mode
IPCC	Intergovernmental Panel on Climate Change
IR	infrared
ISBA	interactions soil–biosphere–atmosphere
ISM	Indian summer monsoon
ISMR	Indian summer monsoon rainfall
ISO	intraseasonal oscillation
ISOV	ISO variability
ISV	intraseasonal variability

ITCZ	intertropical convergence zone
JAMSTEC	Japan Marine Science and Technology Center
JASMINE	Joint Air–Sea Monsoon Interaction Experiment
JJA	June–July–August
JJAS	June–July–August–September
JMA	Japan Meteorological Agency
KMA	Korea Meteorological Agency
L–AI	land–atmosphere interaction
LAI	land–atmosphere interaction
LAI	leaf area index
LASG	Laboratory of Atmospheric Sciences and Geophysical Fluid Dynamics
LBC	lower boundary condition
LF	low frequency
LH	latent heat
LIM	Linear Inverse Model
LLJ	low-level jet
LPS	low-pressure systems
LPSD	low-pass standard deviation
LS	leading stratiform
LSM	land surface model
LSS	land surface schemes
LST	local solar time
LT	local time
MAM	March–April–May
MCC	mesoscale convective complex
MCS	mesoscale convective systems
MCV	mesoscale convective vortex
MEM	maximum entropy method
MH	monsoon Hadley
MIS	marine isotopic stage
MISO	monsoon ISO
MISR	multiangle imaging spectroradiometer
MJJA	May–June–July–August
MJO	Madden–Julian Oscillation
MLD	mixed layer depth
MLM	mixed layer model
MM5	Fifth-Generation NCAR/Penn State Mesoscale Model
MME	multimodel ensemble
MODIS	moderate resolution imaging Spectroradiometer
MONEX	Summer Monsoon Experiment
MONTBLEX	Monsoon Trough Boundary Layer Experiment
MPI	Max Planck Institute for Meteorology
MRF	medium-range forecast
MRG	mixed Rossby–gravity

MRI	Meteorological Research Institute
MSU	Microwave Sounding Unit
MT	monsoon trough
MTC	mid-tropospheric cyclone
NAO	North Atlantic Oscillation
NASA	National Aeronautics and Space Administration
NCAR	National Center for Atmospheric Research
NCEP	National Centers for Environmental Prediction
NCMRWF	National Centre for Medium-Range Weather Forecasting
NCSU	North Carolina State University
NDJF	November–December–January–February
NH	northern hemisphere
NHET	northern hemisphere near-equatorial trough
NIES	National Institute for Environmental Studies
NINO3.4	5°S–5°N, 170°–120°W
NMC	National Meteorological Center
NOAA	National Oceanic and Atmospheric Administration
NRC	National Research Council
NRL	Naval Research Laboratory
NWP	numerical weather prediction
OAI	ocean–atmosphere interaction
OI	optimal interpolation
OLR	outgoing long-wave radiation
OLRA	outgoing long-wave radiation anomaly
OSSE	Observing System Simulation Experiment
OSU	Oregon State University
PBL	planetary boundary layer
PC	principal component
PDF	probability distribution function
PDO	Pacific decadal oscillation
PDS	point-wise downscaling
PENR	Penninsular Indian Rainfall
PHI	Philippine Sea region
PILPS	Project for Intercomparison of Land Surface Parameterization Schemes
PMP	Possible Maximum Precipitation
POP	Principal Oscillation Pattern
PR	precipitation radar
PS	parallel stratiform
PSAC	Philippine Sea anticyclone
PSU	Penn State University
PV	potential vorticity
PWC	precipitable water content
QBM	quasibiweekly mode
QBO	quasibiennial oscillation

QuikSCAT	Quick Scatterometer
QXPME X	Qinghai–Xizang Plateau Meteorology Experiment
RAM	Regional Atmospheric Model
RegCM	Regional Climate Model
RHC	reverse Hadley circulation
RMM	real time multivariate MJO
RWS	Rossby wave source
SACZ	South Atlantic convergence zone
SAH	south Asian High
SAM	south Asian monsoon
SAS	Simplified Arakawa–Schubert Scheme
SCS	South China Sea
SCSMEX	South China Sea Monsoon Experiment
SEAM	southeast Asian monsoon
SECHIBA	Schématisation des Echanges Hydriques à l’Interface entre la Biosphère et l’Atmosphère
SH	southern hemisphere
SHAP	sensible heat driven air-pump
SiB	simple biosphere
SLP	sea level pressure
SMH	Siberian–Mongolian High
SMIP	Seasonal Model Intercomparison Prediction
SMP	Sumatra and Malay Peninsula
SNU	Seoul National University
SOI	Southern Oscillation Index
SON	September–October–November
SPCZ	South Pacific convergence zone
SRES	Special Report on Emission Scenarios
SSA	singular spectrum analysis
SSH	sea surface height
SSiB	simplified SiB
SSM/I	Special Sensor Microwave Imager
SST	sea surface temperature
STA	seasonal transitional axis
STJ	subtropical jet stream
SVD	singular value decomposition
TAMEX	Taiwan Area Mesoscale Experiment
TAO	Tropical Atmosphere–Ocean
TBO	tropospheric biennial oscillation
TC	tropical cyclones
TCZ	tropical convergence zone
TEJ	tropical easterly jet stream
TH	Tibetan High
TKE	Turbulent Kinetic Energy
TMI	TRMM Microwave Imager

TOA	top-of-atmosphere
TOGA	Tropical Ocean–Global Atmosphere
TOPEX	Topography Experiment for Ocean Circulation
TRMM	Tropical Rainfall Measuring Mission
TS	trailing stratiform
TSI	total solar irradiance
U200	200-mb zonal wind
UKMO	United Kingdom Meteorological Office
UTC	universal coordinated time
VP200	velocity potential at 200 hPa
WCR	west central Indian rainfall
WCRP	World Climate Research Programme
WEB	westerlies and easterlies boundary
WGSIP	CLIVAR Working Group on Seasonal to Interannual Prediction
WISHE	wind-induced surface heat exchange
WMO	World Meteorological Organization
WMONEX	winter MONEX
WNP	western North Pacific
WNPSM	western North Pacific summer monsoon
WOCE	World Ocean Circulation Experiment
WWW	World Weather Watch

Acknowledgements

I owe a debt beyond my ability to express it to all contributors to this volume whose dedicated endeavor made this comprehensive volume possible. My acknowledgements are gratefully extended to the following reviewers for their enthusiastic support providing invaluable comments and suggestions for various chapters: Mike Alexander, Congbin Fu, Tim DelSole, Yihui Ding, Saji Hameed, Zengzhen Hu, Ryuichi Kawamura, Ben Kirtman, Akio Kitoh, R. H. Kripalani, Chongyin Li, Eric Maloney, Brian Mapes, Jun Matsumoto, Kohzoh Ninomiya, Delia Oppo, Chung-Kyu Park, Ken Sperber, Yubin Su, Hiroaki Uda, Renguang Wu, Song Yang, and Won-Tae Yun.

During the planning of the book, I benefited from constructive suggestions proffered by many colleagues. I wish to particularly acknowledge suggestions made by Kevin Trenberth, Jerry Meehl, Duzheng Ye (T.-C. Yeh), Takio Murakami, Tom Schroeder, and LinHo.

Over the past 18 years, the National Science Foundation, National Oceanic and Atmospheric Administration, and Office of Naval Research have generously and continuously supported my group in our studies of tropical meteorology and monsoons. My participation of the Asian–Australian Monsoon System studies at the International Pacific Research Center (IPRC) was in part supported by the Frontier Research System for Global Change.

Without invaluable technical assistance from my colleagues and students, this book would be much delayed. Many thanks are extended to Ping Liu who helped with webpage updating and Na Lan who compiled a single consolidated acronym list and a reference list. I appreciate Clive Horwood's encouragement and generous assistance and Larissa Leroux who edited a portion of the manuscript.
