Advances in Polymer Sciences

Also Available Electronically

Advances in Polymer Sciences is included in Springer's eBook package *Chemistry and Materials Science*. If a library does not opt for the whole package, the book series may be bought on a subscription basis. Also, all back volumes are available electronically.

For all customers who have a standing order to the print version of *Advances in Polymer Sciences*, we offer free access to the electronic volumes of the Series published in the current year via SpringerLink.

If you do not have access, you can still view the table of contents of each volume and the abstract of each article by going to the SpringerLink homepage, clicking on "Browse by Online Libraries", then "Chemical Sciences", and finally choose *Advances in Polymer Science*.

You will find information about the

- Editorial Board

- Sample Contribution

at springer.com using the search function by typing in *Advances in Polymer Sciences*.

Color figures are published in full color in the electronic version on SpringerLink.

Aims and Scope

The series *Advances in Polymer Science* presents critical reviews of the present and future trends in polymer and biopolymer science including chemistry, physical chemistry, physics and material science. It is addressed to all scientists at universities and in industry who wish to keep abreast of advances in the topics covered.

Review articles for the topical volumes are invited by the volume editors. As a rule, single contributions are also specially commissioned. The editors and publishers will, however, always be pleased to receive suggestions and supplementary information. Papers are accepted for *Advances in Polymer Science* in English.

In references *Advances in Polymer Sciences* is abbreviated as *Adv Polym Sci* and is cited as a journal.

Special volumes are edited by well known guest editors who invite reputed authors for the review articles in their volumes.

Impact Factor in 2009: 4.600; Section "Polymer Science": Rank 4 of 73

Preface

Biosciences and material sciences emerged initially as distinct disciplines. However, recent progresses in polymer and material sciences led to congruent research interests, thus fusing the fields of material and biosciences progressively. To concretize visionary ideas such as adaptive bio-host systems, bio-instructive materials, bio-integrated functional systems, or regenerative tissue engineering, the interfaces between synthetic materials and biological systems have been identified as one key issue. The present volume of *Advances in Polymer Science* covers the most important aspects of the emerging area of “Bioactive Surfaces.” Selected experts in the field of polymer science, soft-matter engineering, and biophysics have been invited to highlight their personal views and perspectives on this crucial field of research.

Even though molecular biologists developed lately precise analytical tools of genomics, regulomics, and proteomics, allowing for progressively accurate insight into systemic functions of cells and tissues, the interfaces between synthetic materials and biological systems are still far from being fundamentally understood. In the last decade, joint multidisciplinary efforts and intense exchange between the biology and materials research communities set the focus on signaling of materials toward biological systems. Cells or cell populations at a bio-material interface experience a broad spectrum of chemo-, mechano- physico-, and topological signals, which are interpreted by the biosystem. This triggers distinct responses, which often occur on all functional bio-hierarchy levels from altering cell metabolism to changing cell status, regulating cell proliferation, differentiation or motility to macroscopic changes of the cell shape, orientation, migration, or adhesion behavior. Fundamental understanding of the events and responses paves the way to actively communicate with biological systems via the material-interface to influence, guide, or direct cells and tissues. This promises enormous progress for life science applications, however, puts challenges on materials design and accurate fabrication, as precisely tailored materials and interfaces are mandatory.

In this exciting context, this volume provides a broad overview on the field of synthetic biologically active surfaces. In particular, three important aspects are emphasized in this volume: (1) surface design, (2) interactions of 2D and 3D surfaces with biosystems, and (3) applications. Regarding surface preparation and modification, the reader will find in this book a practical description of synthetic tools, which constitute the state of the art in the field. For instance, surface functionalization

strategies, using responsive polymer brushes (Chap. 1), peptide arrays (Chap. 2), self-assembled monolayers (Chap. 4), or polyelectrolyte multilayers (Chap. 5), are described in this volume. The middle section of this book (i.e. Chaps. 3–6) describes principally the interactions of 2D and 3D surfaces with biological systems. For instance, important topics such as surface nanostructuring (Chap. 3), the fabrication of micro-reservoirs (Chap. 5), and the preparation and processing of active 3D scaffolds (Chap. 6) are specifically addressed in this volume. Furthermore, practical applications of synthetic bioactive surfaces are described throughout the book. In particular, concrete examples of applications in research fields as diverse as tissue engineering, drug delivery, biochips, biosensors, bioseparation, cell engineering, stem-cell differentiation, and antimicrobial surfaces are discussed in this volume.

The editors express their thanks to the authors and to the Springer editorial team for their help in publishing this book.
