*This book is for the residents and young neurosurgeons
deciding to embark upon vascular neurosurgery, which is a
life-long journey with an uncertain destination.*

Preface

Microsurgery of cerebral aneurysms has gone a long way since the publication of the first book on the topic by Walter Dandy in 1944. Development of aneurysm surgery coincided to a large degree with the development of microsurgical techniques in general. Accumulation of detailed technical knowledge and also pathophysiological understanding led to the publication of a monumental three-volume text by John Fox in 1983. Aneurysm microsurgery was special, it was difficult, and it was not for everyone. It was challenging. The advent of endovascular coiling in 1990 had a deep impact on the microsurgical landscape. It was realized long before the publication of the ISAT results (International Subarachnoid Aneurysm Trial) in 2002 that the endovascular approach could treat aneurysms of the basilar apex with much less risk than microsurgery. Publication of the ISAT results involved a number of consequences. Microsurgery has become the second choice for cases in which the endovascular therapist encounters difficulties. Depending on the local team, more difficult aneurysms could be left for surgery. On the other hand, the neurosurgeon does not need to operate on all difficult aneurysms. Surgery can avoid risky cases. The team interaction is certainly critical for the balance between the two disciplines. There are currently large differences across Europe with regard to the proportion of aneurysms being coiled and clipped. These differences are essentially a consequence of the competitive nature of coiling and clipping. To eliminate factors of competition among disciplines, the neurovascular surgeon competent with microsurgical and endovascular techniques emerged in the United States and Japan, among others. In Europe, attempts were made to establish such a system in a few places but without much success. Therefore, the interdisciplinary team approach remains the European standard. The current average relation between clipping and coiling is quite balanced (around half and half) in Europe.

Aneurysm microsurgery remains special and challenging. Microsurgical techniques are innate to the current generation of neurosurgeons. As such, a modern book of aneurysm microsurgery can avoid repeating basic microsurgical techniques. This was the basis when we decided to analyze our experience of the last decades and summarize essential clues for success.

Technical development of aneurysm microsurgery was largely stunned by the advent of endovascular therapy. Since it is becoming quite clear that microsurgical techniques for brain aneurysms will be needed at least for the next decades, we are convinced that technical development must be intensified.

At our center, the traditional large openings resulting in stigmatizing disfigurations have been replaced by small targeted craniotomies. It is a main focus of the present book to introduce the targeted approaches and the resulting specific clipping techniques.

Management of subarachnoid hemorrhage and the technical act of clipping a brain aneurysm requires a deeper understanding of pathophysiology and hemodynamics because these factors determine the typical constellations, configuration, and consequently approach and clipping techniques. Therefore, the hemodynamic principles and resulting types of aneurysm are depicted in the first part of this book.

Contents

1	The Current State of Aneurysm Microsurgery	1
1.1	Clip or Coil?	1
1.2	To Treat or Not to Treat Incidental Aneurysms?	2
1.3	The Enigma of Secondary Ischemic Damage Following Subarachnoid Hemorrhage.	4
1.4	Primary Prevention of Aneurysm Formation.	4
	References.	5
2	Pathophysiology and Anatomy	7
2.1	Terminal Versus Lateral Aneurysms	7
2.2	Geometry of Bifurcations	9
2.3	Aneurysm Projections and Blood Flow	14
2.4	Shape of Aneurysm Necks.	19
2.5	Aneurysm Sizes	22
2.6	Aneurysm Contours	23
2.7	Nonsaccular and Complex Aneurysms	24
	References.	25
3	Perioperative Management of Patients with Subarachnoid Hemorrhage	27
3.1	Guidelines for the Admission	27
3.2	Initial Assessment	27
3.2.1	Clinical Examination	27
3.2.2	Computed Tomography	28
3.2.3	Cerebral Perfusion Monitoring	28
3.2.4	Angiography	28
3.2.5	Exceptions	28
3.3	Choice of Treatment Modality and Timing of Securing the Aneurysm.	29
3.4	Initial Management (Before Elimination of Aneurysm)	29
3.4.1	General Measures.	29
3.4.2	Analgesia and Sedation	30
3.4.3	Blood Pressure Control	30
3.5	Preoperative Measures	30
3.6	Postoperative Treatment.	30
3.6.1	Medication and Fluid Therapy	30
3.6.2	Controls	31
3.6.3	Mobilization.	31

3.7	Treatment of Symptomatic Vasospasm	31
3.7.1	General Considerations	31
3.7.2	Diagnostics.	32
3.7.3	Treatment of Symptomatic Vasospasm in the ICU.	32
3.7.4	Management of Hydrocephalus	33
3.8	Treatment of Patients with SAH Without an Angiographically Proven Source of Bleeding.	34
	References.	34
4	Surgical Approaches	35
4.1	General Philosophy and Procedures	35
4.1.1	Approaches	35
4.1.2	CSF Drainage.	37
4.1.3	Intraoperative Monitoring	38
4.1.4	Neuronavigation.	38
