Preface

Synapses are sites of a specialized cell-cell contact between neuronal cells and represent the major structure involved in chemical neurotransmission in the nervous system. It is widely believed that glutamatergic synapses are important loci for modifying the functional properties of CNS networks, possibly providing the basis for phenomena collectively referred to as “learning and memory”. Given their importance, it is not surprising that enormous efforts are being made to understand the formation, structure, function and regulation of glutamatergic synapses. To date, significant progress has been made in our understanding of their ultrastructure, molecular composition, and physiological properties, as well as the principles of how these synapses are initially assembled and “plastically” modified.

The term synaptic plasticity covers many different aspects of use-dependent synaptic modifications and is commonly used in a broader sense describing aspects of synaptic signal transmission as well as structural alterations in the molecular make-up of the synapse related to synaptic signaling events. The capacity of the nervous system to modify its own organization is remarkable; plastic changes can occur as a consequence of many events, including the normal development and maturation of the organism, the acquisition of new skills (‘learning’) and after brain damage. This response specificity is not always intrinsic to neurons; rather, it can develop as a consequence of interaction with the environment and thus involves information processing and memory storage.

Disturbances of synaptic and neuronal plasticity ultimately result in diseases affecting cognitive functions and it has become increasingly clear during recent years that synaptopathies – disruptions in synaptic structure and function – in many cases are the major determinant of many brain disorders. These diseases and related animal models include Alzheimer’s, prion diseases, Down’s syndrome, Huntington’s or Parkinson’s diseases as well as schizophrenia and autism spectrum disorders that almost ultimately result in disturbed plasticity processes. In accord, it is becoming increasingly clear that studies of synaptic plasticity and memory formation are critical for understanding the initial stages of these disorders. At an early stage in most of these diseases no structural damage exists but rather an impairment

of synaptic function. Interventions aimed to preserve or even restore synaptic function will probably delay the onset or might even provide a cure for such disorders. A general strategy to treat these types of diseases can therefore be plausibly based on knowledge, how to maintain the plastic properties of neurons in the adult and aging brain.

Crucial technological advancements have recently accelerated progress in our understanding of synaptic processes, five of them are listed here: (1) Live-cell imaging has provided essential constraints regarding the kinetics (rate constants) and spatial organization of signaling pathways, (2) the development of next generation sequencing allows individual transcriptome profiling, (3) quantitative synaptic proteome profiling of normal and disease brain has established protein interaction networks databases for signaling pathway analysis, (4) optogenetic tools are available to study neuronal function *in vivo*, (5) and finally, progress in computer simulation and neuroinformatics has been crucial for improving the temporal and spatial scale of synaptic plasticity models, because simulating large spatial structures for long durations with high resolution requires trillions of calculations.

In higher mammals the majority of brain glutamatergic excitatory synapses is found on the principal neuron of the cortex and hippocampus, the pyramidal cell. Pyramidal cells are characterized by a complex dendritic cytoarchitecture harboring approximately 10^4 – 10^5 synaptic contact sites with other neurons. It is estimated less than 1% of all synaptic contacts of cortical pyramids is concerned with the wiring to subcortical areas, implying that the predominant synapse of the mammalian telencephalon is concerned with input from a closely related neuron in terms of cell lineage, morphology and functional characteristics. This fact is mainly emphasized because our knowledge about synaptic plasticity of this type of synaptic input is still very sparse.

We have focused our attention in this book mostly on postsynaptic molecular mechanisms because a lot more knowledge exists with respect to this side of the synapse especially with respect mechanisms underlining synaptic dysfunction and synaptopathies. The purpose of this book is to summarize this knowledge and to provide insights into the most recent developments in the field including the major technological advancements in recent years. The first part of the book concerns structural plasticity at the pre- and postsynaptic scaffold, the molecular dynamics of the synapse and synapto-dendritic plasticity in development and learning. In the second part the book includes chapters on synapse-to-nucleus communication and synaptic dysfunction and synaptopathies. Finally, we want to particularly thank the authors for their contribution. We are very happy that we could convince leading experts in this field to provide a detailed account of the most exciting recent developments.

Contents

Part I Molecular Organization of the Pre- and Postsynaptic Scaffold

1 Glutamate Receptors in Synaptic Assembly and Plasticity: Case Studies on Fly NMJs	3
Ulrich Thomas and Stephan J. Sigrist	
2 Scaffold Proteins at the Postsynaptic Density	29
Chiara VerPELLI, Michael J. Schmeisser, Carlo Sala, and Tobias M. Boeckers	
3 Diversity of Metabotropic Glutamate Receptor–Interacting Proteins and Pathophysiological Functions	63
Laurent Fagni	
4 Regulation of the Actin Cytoskeleton in Dendritic Spines	81
Peter Penzes and Igor Rafalovich	
5 Synaptic Cell Adhesion Molecules	97
Olena Bukalo and Alexander Dityatev	

Part II Molecular Dynamics of the Synapse

6 Molecular Dynamics of the Excitatory Synapse	131
Shigeo Okabe	
7 The Brain’s Extracellular Matrix and Its Role in Synaptic Plasticity	153
Renato Frischknecht and Eckart D. Gundelfinger	

8	Molecular Motors in Cargo Trafficking and Synapse Assembly	173
	Robert van den Berg and Casper C. Hoogenraad	
9	Surface Traffic in Synaptic Membranes	197
	Martin Heine	
10	Synaptic Protein Degradation in Memory Reorganization	221
	Bong-Kiun Kaang and Jun-Hyeok Choi	
11	AMPA Receptor Assembly: Atomic Determinants and Built-In Modulators	241
	Madhav Sukumaran, Andrew C. Penn, and Ingo H. Greger	
12	Developmental Plasticity of the Dendritic Compartment: Focus on the Cytoskeleton	265
	Malgorzata Urbanska, Lukasz Swiech, and Jacek Jaworski	
13	Dendritic mRNA Targeting and Translation	285
	Stefan Kindler and Hans-Jürgen Kreienkamp	
14	Gliotransmission and the Tripartite Synapse	307
	Mirko Santello, Corrado Calì, and Paola Bezzi	
 Part III Synapse-to-Nucleus Communication		
15	Roles of Neuronal Activity-Induced Gene Products in Hebbian and Homeostatic Synaptic Plasticity, Tagging, and Capture	335
	Yasunori Hayashi, Ken-ichi Okamoto, Miquel Bosch, and Kensuke Futai	
16	Long-Distance Signaling from Synapse to Nucleus via Protein Messengers	355
	Anna Karpova, Julia Bär, and Michael R. Kreutz	
17	Nuclear Calcium Signaling	377
	C. Peter Bengtson and Hilmar Bading	
18	Integrating Neurotransmission in Striatal Medium Spiny Neurons	407
	Jean-Antoine Girault	

Part IV Synaptic Dysfunction and Synaptopathies

19 Synaptic Dysfunction and Intellectual Disability 433
 Pamela Valnegri, Carlo Sala, and Maria Passafaro

20 Synaptic Pathology of Down Syndrome 451
 Craig C. Garner and Daniel Z. Wetmore

21 The Synaptic Pathology of Drug Addiction 469
 Michel C. Van den Oever, Sabine Spijker, and August B. Smit

22 Synaptic Dysfunction in Schizophrenia 493
 Dong-Min Yin, Yong-Jun Chen, Anupama Sathyamurthy,
 Wen-Cheng Xiong, and Lin Mei

**23 Molecular and Cellular Aspects of Mental Retardation in the
 Fragile X Syndrome: From Gene Mutation/s to Spine
 Dymorphogenesis** 517
 Silvia De Rubeis, Esperanza Fernández, Andrea Buzzi,
 Daniele Di Marino, and Claudia Bagni

24 Synaptic Dysfunction in Parkinson’s Disease 553
 Barbara Picconi, Giovanni Piccoli, and Paolo Calabresi

25 Synaptic Dysfunction in Alzheimer’s Disease 573
 Elena Marcello, Roberta Epis, Claudia Saraceno, and Monica Di Luca

Erratum to: Gliotransmission and the Tripartite Synapse E1
