Contents

	<i>Introduction</i>	9
I.	<i>Body composition and metabolic activity of tissues during ontogenesis</i>	15
	1. Ratio of lean body mass and fat in relation to energy turnover	15
	2. Composition of lean body mass	18
	3. Composition and metabolic activity of adipose tissue	20
	4. Lipid metabolism in muscular tissue	22
II.	<i>Lean body mass and depot fat during ontogenesis in humans</i>	24
	1. Changes in subcutaneous fat during ontogenesis	25
	2. Ontogenetic changes of the total body fat and lean body mass ratio	32
	3. Relationship of total and subcutaneous fat during ontogenesis	36
	4. Results of comparison of skinfolds measured by means of different calipers	47
III.	<i>Changes in the maximum level of metabolic activity of lean body mass during ontogenesis</i>	52
	1. Changes of the relationship of aerobic capacity and lean body mass during ontogenesis	52
	2. Changes in the capillary network in skeletal muscle in relation to body composition and aerobic capacity	56

IV.	<i>Some consequences of adaptation to increased or restricted activity during ontogenesis</i>	60
	1. Growth curves and body composition during adaptation to different loads	61
	2. Caloric intake and physical activity	71
	3. Catecholamine synthesis and degradation in relation to physical activity and body composition.	77
	4. Excitability of the central nervous system in relation to physical activity and body composition	80
V.	<i>Influence of adaptation to increased muscle work on body composition in relation to caloric intake in man</i>	83
	1. Changes in body composition after adaptation to increased muscle work	83
	2. Caloric intake during periods with different physical activity.	85
VI.	<i>Adaptation to increased muscular work: consequences in adipose tissue</i>	88
	1. Metabolic activity of adipose tissue and fatty acid utilization during adaptation to different loads	90
	2. Deoxyribonucleic acid content in adipose tissue during adaptation to different loads	95
	3. Fatty acid uptake and their inflow rate to adipose tissue in animals with different levels of activity	98
	4. Ratio of individual fatty acids in adipose tissue	101
VII.	<i>Adaptation to different loads: consequences in the lipid metabolism of skeletal and heart muscle and other organs.</i>	104
	1. Weight, fibre size and percentage of fat in muscles during different activities and in different age groups	104
	2. Lipoprotein lipase activity in heart and skeletal muscle after adaptation to different loads	107
	3. Cholesterol formation during different levels of physical activity	112
	4. Influence of increased physical activity during prenatal ontogenesis on the lipid metabolism in the offspring	114
VIII.	<i>Effect of increased physical activity on body composition during growth in different groups of children (longitudinal studies).</i>	118

1. Somatic and functional development of preschool children . . .	119
2. Body build and body composition in boys engaged and not engaged in physical training	126
3. Body composition in relation to aerobic capacity in boys . . .	130
4. Functional characteristics and composition of weight increments in boys with different physical activity during adolescence	133
5. Stability of body composition characteristics in boys during adolescence	141
6. Influence of physical activity on stability of somatotype in boys during adolescence	146
7. Body build and composition of girl gymnasts and of non-training girls	152
8. Comparison of the development of body composition in girls and boys engaged in swimming training	156
9. Relationship between development of body weight, body composition and functional development	159
10. Body composition and fitness of youth in relation to socio-economic conditions	162

IX.

Consequences of adaptation to increased physical activity in obese children

1. Somatic characteristics of obese children	170
2. Heart volume in obese children	173
3. Economy of work in obese children	174
4. Effect of adaptation to prolonged increased load on body composition and indicators of the lipid metabolism in blood. . .	175
5. Changes in the response of vegetative functions to a load in obese children after weight and fat reduction	179
6. Changes of anthropometric indicators after repeated reductions of body fat during growth in obese children	185
7. Conditions for the maintenance of reduction of body fat during repeated treatment	187
8. Changes in the aerobic capacity after weight reduction in obese boys.	188
9. Consequences of reduction treatment of child obesity in adult age	191

X.

Body composition and body build of champion athletes in relation to fitness and performance.

1. Characteristics of body build and composition of champion athletes	198
---	-----

2. Lean body mass in relation to functional characteristics in champion athletes.	201
3. Changes in body composition during Olympic training of gymnasts	205
4. Body composition during excessive training.	207

XI.

<i>Body composition, body build and fitness of elderly men with a different life-long regime of physical activity</i>	209
---	-----

1. Body composition and body build in active and inactive men of advanced age.	210
2. Body composition in relation to aerobic capacity	212
3. Body composition in relation to muscular strength.	212
4. Body composition in relation to sports performance	215
5. Density of the capillary network in skeletal muscle and body composition	216
6. Indicators of the lipid metabolism in blood in relation to physical activity and body composition.	217
7. Long-term investigation (8 – 10 years) of changes in body composition and somatic characteristics in old men with different activity.	217
8. Body composition and somatic indicators with regard to the perspective of longevity	221
9. Relationship of body composition and changes in performance and aerobic capacity of old men after 8 – 10 years	222

XII.

<i>Relationship between body composition and physical activity and the development of experimental cardiac necrosis in male rats of different age</i>	225
---	-----

1. Effect of age, body weight and body composition on the development of experimental myocardial necrosis in made rats	226
2. Effect of adaptation to increased or reduced physical activity	230
3. Density of the capillary network in the heart muscle in male rats after a different load during postnatal ontogenesis	233
4. The impact of work load during prenatal ontogenesis on the subsequent development of the offspring	237

XIII.

<i>Summary.</i>	240
-------------------------	-----

XIV.

<i>General conclusions and perspectives</i>	252
---	-----

<i>References</i>	262
