## **Dedication**

The *Materials Concise Reference Guide* is dedicated to my father Antonio and my mother Claudine, to my sister Elsa, and to Louise Saint-Amour, for their love and support. In addition, I want to express my thanks to my two parents and my uncle Consalvo Cardarelli, who in close collaboration provided valuable help when I was teenager to contribute to my first fully equipped geological and chemical laboratory, and to my personal scientific library. This was the starting point of my strong and extensive interest in both science and technology, and gluttony for scientific and technical literature.

François Cardarelli

## **Acknowledgments**

Grateful thanks go to Mr Nicholas Pinfield (Engineering Editor, London), Mr Jean-Étienne Mittelmann (Editor, Paris), Mrs Alison Jackson (Editorial Assistant, London), and Mr Nicolas Wilson (Senior Production Controller, London), for their valued assistance, patience, and advice.

## Units Policy

In this book all the units of measurement used for describing physical quantities are those recommended by the *Système International d'Unités* (SI). For accurate conversion factors between these units and the other non-SI units (e.g., cgs, fps, Imperial and US customary) please refer to Cardarelli, F., *Scientific Unit Conversion: A Practical Guide to Metrication*, 2nd edition, Springer-Verlag, London (1999), 488 pp.

## Author Biography

Dr François Cardarelli

Born in Paris XV (France), 17 February 1966.

## Academic Background

- PhD in Chemical Engineering (Univ. Paul Sabatier, Toulouse III), (1996)
- MSc in Electrochemical Engineering (Univ. Pierre and Marie Curie, Paris VI), (1992)
- BSc in Physical Chemistry and Nuclear Engineering (Univ. Pierre and Marie Curie, Paris VI/Conservatoire National des Arts et Métiers, CNAM), (1990)
- Associate Degree in Geophysics and Geology (Univ. Pierre and Marie Curie, Paris VI). (1987)
- Baccalaureate C (Maths, Phys & Chem) (1985)

## Areas of Work

The successive areas of work from 1990 until the present are, in chronological order: (1) Research scientist at the Laboratory of Electrochemistry (Univ. Pierre & Marie Curie, Paris, France) for the development of a nuclear detector device for electrochemical experiments involving beta radiolabelled compounds. (2) Research scientist at the Institute of Marine Biogeochemistry (CNRS & École Normale Supérieure, Paris, France) for the environmental monitoring of heavy metals pollution by electroanalytical techniques. (3) Research scientist for the preparation by electrochemistry in molten salts of tantalum protective thin coatings for the chemical process industries (Sponsored by Electricité de France). (4) Research scientist for the preparation and characterization of iridium-based industrial electrodes for oxygen evolution in acidic media at the Laboratory of Electrochemical Engineering (Univ. Paul Sabatier, Toulouse, France). (5) Registered consultant in Chemical and Electrochemical Engineering (Toulouse, France). (6) Battery Product Leader at the Technology Dept. of ARGOTECH Productions, Inc., Boucherville (Québec) Canada in charge of both the electric vehicle, stationary and oil drilling applications of the lithium polymer batteries. (7) Materials Expert and Industrial Electrochemist at the Lithium Dept. of ARGOTECH Productions, Inc. involved in both the metallurgy and processing of lithium metal anodes, and the recycling of spent lithium polymer batteries. (8) Materials Expert and Industrial Electrochemist at the Technology Dept. of AVESTOR Corp., Boucherville (Quebec) Canada, in charge of all the strategic raw materials entering in the fabrication of lithium polymer batteries, and the recycling process of spent lithium batteries. (9) Metallurgist Research Specialist at the Technology Dept. of Rio Tinto Iron and Titanium Inc., Sorel-Tracy (Québec) Canada.

# Introduction

Despite the several comprehensive series available in Material Sciences and their related fields, it is a hard task to find grouped properties of metals and alloys, ceramics, polymers, minerals, woods, and building materials in a single volume source book. Actually, the scope of this practical handbook is to provide to scientists, engineers, professors, technicians, and students working in numerous scientific and technical fields ranging from nuclear to civil engineering, easy and rapid access to the accurate physico-chemical properties of all classes of materials. Classes used to describe the materials are: (i) metals and their alloys, (ii) semiconductors, (iii) superconductors, (iv) magnetic materials, (v) miscellaneous electrical materials (e.g., dielectrics, thermocouple and industrial electrode materials), (vi) ceramics, refractories, and glasses, (vii) polymers and elastomers, (viii) minerals, ores, meteorites, and rocks, (ix) timbers and woods, and finally (x) building materials. Particular emphasis is placed on the properties of the most common industrial materials in each class. Physical and chemical properties usually listed for each material are (i) mechanical (e.g., density, elastic moduli, Poisson's ratio, yield and tensile strength, hardness, fracture toughness), (ii) thermal (e.g., melting point, thermal conductivity, specific heat capacity, coefficient of linear thermal expansion, spectral emissivities), (iii) electrical (e.g., resistivity, dielectric permittivity, loss tangent factor), (iv) magnetic (e.g., magnetic permeability, remanence, Hall constant), (v) optical (e.g., refractive indices, reflective index), (vi) electrochemical (e.g., Nernst standard electrode potential, Tafel slope, specific capacity) and (vii) miscellaneous (e.g., corrosion rate, thermal neutron cross section, natural abundances, electron work function, Richardson constant). Detailed appendices provide additional information (e.g., properties and cost of the elements, molten salts and liquid metals, crystallographic calculations), and an extensive bibliography completes this comprehensive guide. The comprehensive index and large format of the book enable the reader to locate and extract the relevant information quickly and easily. Charts and tables are all referenced and tabs are used to denote the different sections of the book. It must be emphasized that the information presented here is taken from several various scientific and technical sources, and has been meticulously checked; every care has been taken to select the most reliable data.
