

## Sustainability and Peace: “Urban Health from the Physical Dimension”

In the first part of studying sustainability and peace, we present three primary aspects representing urban health from the physical dimension.

The first aspect is urban density and land use, exploring the health-related matters that should be considered from the planning and design perspectives. These are discussed in Chap. 3, focusing on keeping the peace and security of the built environment through better planning and advocating compact design development but with some key considerations. The second aspect is urban morphology and form, highlighting an

overarching area of resilient urban form, specifically discussing the spatio-morphological aspect of cities and communities. These are discussed in Chap. 4, explicitly exploring the health and safety of communities from the urban form perspective. The third aspect is critical infrastructures, including a range of critical physical environments and uses in cities, suggesting their role in sustaining the peace in our communities. This important aspect is presented in Chap. 5, identifying the importance of critical infrastructures in achieving urban health, sustainability, and peace.
